Then if all goes well (Test it at home first), and its not -50 below 0 at your site, eventually (approx 5 minutes) the heatsink reaches high enough temperature to open. They the heatsink and everything cools down, it closes and you are back on the air. Whole cycle takes about 20 minutes. Not bad considering it also disconnects your supply during that time (Might help with further strikes)

2717. IC-820 and splits

Newsgroup: rec.radio.amateur.equipment
Date: 1997-07-31 00:00:00 UTC
From: N8XYN <jim.N8XYN@worldnet.att.net>
Message-ID: <33E07218.673F@worldnet.att.net>
Source record: 169037

Does anyone know if its possibal to get odd splits on the IC-820? I want to work MIR and need to go up and down on 430 Mhz. The only way I can think to do this is to program the frequency then set the overall FM split to 2.2 Mhz (This will effect all repeater pairs until I reset it to 5 Mhz). The 820 isnt really all that Sat ready. 73's

>Thanks,

>Tom

The FCC DOES NOT require that repeaters (or any other station for that matter)
identify automatically. This is normally done with repeaters to take the
burden of sending the repeater ID of f of the user. If your call sign is
W3XYZ and you're operating through your mobile rig running as a crossband
repeater all you have to do is Identify as such by saying something like "This
is W3XYZ via W3XYZ repeater." If you identify like this at the beginning and
end of each contact and at least every ten minutes during a QSO, you're
perfectly legal.

I just interfaced (older) AH-1 to my IC-706. Using an 8 ft wire to simulate the whip, it seems to work fine. Need to install it in the mobile now. Basically, it's a switched "L" network that switches based on the variable analog band voltage from the IC-706 (and most other solid state icoms). If there's sufficient interest, I will post the cable diagram on the newsgroup.

>
> Uhhhh, right?

Uhhhhhh - WR0NG !!!

The 1/4 wavelength rod mounted on an infinite ground plane has 1/2 the
apperature of the 1/2 wavelength (di-pole) antenna.

Therefore:

The ERP (Effective Radiated Power) of the 1/4 wavelength antenna will be
1/2 that of the 1/2 wavelength antenna... a 3 dB decrease.

The "gain" of a 1/4 wavelength antenna on an infinite ground plane is -3
dBd or -.86 dBi... It has a smaller apperature than a theoretical
antenna with no dimensions!

> I get on 2 meters FM

On transmit, the proposed arrangement would give you about a 15 db improvement and on receive about 10 dB. (BTW, take advertised antenna gain claims with a grain of salt!).

In free space, you would roughly quadruple your range. Unfortuntely, you are not in free space
and earth curvature becomes the over-riding factor. It's very hard to predict because of the
numerous factors such as antenna height, terrain, etc., but I would guess something on the order
of a 30 to 50% range improvement might be possible.

Remember, FM requires a high signal to noise ratio to work. Going to SSB would greatly increase your range. With 160 W and a 15 dB Yagi on SSB you could routinely do 100+ miles simplex. With ducting, several hundred miles would be possible.

Hello Cathi

I have found out the hard way about running antennas on the roof. This is generally an invitation to the kind of interference you are experiencing. Also, the difference in power output from the 757 GX and the L4B is only about 10db. I have also found that the additional 10db can cause a lot more headaches with interference. 99% of the time high power is simply not needed to maintain communications. If you husband is a rabid DXer maybe he can justify it, but generally the increase in output is not worth all the collateral hassel. There are different fixes for every problem you are relating. The use of ferrite beads and choks in all the connections to your home theater set up would probably help. moving the antenna as far from the house as possible would definately help and going to the best coax available and maybe a common mode filter could do the trick. You husband should understand what all of this is.

My wife is my biggest critic when it comes to me interefearing with anything in the house. She lets me know as soon as she notices it and I get to work to track it down. I have been able to make the house and all its electronic goodies free from RF interference other than cable channel 18 while running two meters. Have not cracked that as yet. Also If you

are getting this level of intereference problems, what are your neighbors getting?

Good Luck

Source record: 168856

I just put together a charger for my FT50 using a switching power supply
that should be able to supply 5 amps or so. I have found that, with the
rubber duck attached but no battery, I see the power supply either switch
off for a second or two or drop down very low. The funny thing is that this
only happens on some frequencies - and seemingly not when I have a homemade
J-pole hooked up.

A local guru I know suspects that some RF may be getting into the power
supply and affecting it (maybe switching it off since it is a switching
supply) and suggested I try an RF choke in the DC supply line. I haven't
had a chance yet.

Source record: 168860

While surfing the web I came across the Radio Shack web site and
found a library of instruction manuals for their various products.

If you need an instruction manual it may be listed. For instance they
had the HTX-202 instructions as well as instructions for their GMRS radios.
(even instructions for radios they no longer sell, such as the prs-100)

There are software drivers and computer setup programs for their various
pc models also.

The support library is located at:

http://support.tandy.com/

A beam would help as well...

The amp will provide 3x power, or about 2 db.

An 11 element beam will provide maybe 8db over a the vertical
you're currently using. Like going to 500w with the vertical.

Besides, if you're working into repeaters, directional antennas are
just fine, as you KNOW where said repeater is located.

Just went hiking up a 10,000' mountain, 3000' above Flagstaff, Arizona.

Line-of-sight to the other nearby mountain (25 miles!)...
into the machine full quieting on 100 mW, and it would've been
less if I could drop the power down any further.

Wish I'd dragged the 40m QRP rig/antenna/battery up there
for some decent DX...nothing like a 2500' high antenna :)

Source record: 168864

I have a Cushcraft R5 radial-less vertical for sale or trade. Covers 10-12-15-17-20 meters, SWR 2:1 or less on all parts of each band. Three years old, only in air one year in Georgia, one year in TN., stored one year. Mounted on my garage roof and working fine as I type this. Can be ground or roof mounted. Very good condition. Sale price $200 (UPS ground shipping included in continental USA) or want to use as part of a trade for a good condition triband yagi, capable of 1500 watts CW. Model not particularly important but I do like Hy-Gain.

Respond by e-mail to <srobbins@usit.net>

I've beleive it is strictly speaking a violation unless you manually ID the uhf transmissions per
the regulations.

As a question, I understand the State Highway Patrol cruisers typically run vhf low band gear
on statewide repeater sytems and use HT's as mobile extenders while on foot, two way cross band
repeating between vhf-low band and uhf. The question is do they ID their uhf transmissions. As
far as I can recollect they are doing exactly the same thing amateurs are doing and I doubt they
abide by regulations which differ from part 97 very much.

Any scanner listeners ever hear an ID on these transmissions???

Tim

It's true, Yaesu could have lowered the scan rate to give the CTCSS decoder
time to operate. Scanner enthusiasts generally don't like slow scan rates though.
Remember that most scanners don't even offer CTCSS decode. The fact that
the VX-1R offers it at all is more a result of it being for the amateur side of the
radio, and not for the scanner side.

Hi Michel,

Not your power or mode (SSB or FM) will be the issue, but the altitude of your antenna, and the person who you're trying to contact. Except from some special conditions on 2m, direct sight is necessary for 2m operations. As an example, I can reach a repeater about 140 km away with 4 Watts, another only 70 km away can't be reached with 50 Watt.

If you really want to make long distance contacts, go for your CW test (I have to do mine as well, and it's at 12 WPM in Belgium !) and start on HF.

Source record: 168902

Hi !

I have heard that some hams have problems with the RAM-battery on the ICOM 751.
I bought my 751 in 1987, so now I wonder if someone have any experience with the lifetime on this battery.

I also have a second question.
After many years only working phone, I bought myself a paddle for CW. When I work on 40m in the evenings I have problems with the crowded bands, and the fact that the 751 do not have a CW filter. I use to turn the PassBandTuning counter-clockwise, and that makes some improvement.
I wonder if I bought a 500 Hz or 250 Hz filter, how much better my reception would be. I have contacted ICOM in Norway, and these filters costs about 150$ each. Since this rig is 10 years old I will not spend too much money on equipment I cannot use later.
Could someone suggest which of the filters I should buy, if any ?

Can anyone help me? I need to install a 2M mobile in my Ford Ranger.
It has a floor shifter, so a hump mount is out and there is no good
place for a dash mount either.

I remember seeing in some mag. a radio mount that was made out of a
peice of pipe that was bolted to the floor and you hung your radios off
platforms on the pipe.

Does anyone else remember this mounts and who sell them? Do you have
any other possible suggestions on mounting my radio?

Thanks and 73,

Sounds like you're a perfect candidate for HF. Why not spend a little time working on the code, spend a little more time studying for General and get some HF privileges.

That's what I did. I was a no-code Tech, and I felt it was time to advance. I didn't necessarily need the HF priviliges, but I wanted to leave the Tech class altogether. I learned the code at about 15-18 wpm, took the General test, and passed the 13 wpm code test. Then I was General. But there's only one little theory test keeping me from Advanced, so I took that. I'm happy at Advanced until this winter -- then I'll make the move to Extra. Believe me, it's really not hard to do, and it doesn't take that much time. Maybe it'd take more time if I spent half my time complaining about the code, but the code isn't that hard -- so why complain!

There's another reason to upgrade, too. If you're in a club with a lot of Techs, they'll be intrigued and inspired to match your upgrade. Before I upgraded, no one in my club was really interested in upgrading. Then they saw a 26 year-old "kid" make Advanced, and that got them thinking. Since then, one General upgraded to Extra, and another Tech upgraded to Advanced. It works!

Besides, I'm the new president of the club, and I didn't feel a no-code Tech was worthy of the position, so I upgraded 'cause of that, too!

Enough of my babbling. You sound interested in achieving hyper-VHF distances with your communications, why not just upgrade a little, and communicate on the bands that were meant for those distances! Once you start passing those tests, you'll get a fever -- if you can make General, you won't want to stop there!

73 and good luck!

Thanks for all the responses both here and by e-mail. The answer is
that it is normal for these power supplies to run hot. There is a
thermal breaker in the RS-50 cabinet (mine has a blue caplug on the
outside) in the event it get too hot. But the gist of it is it will get
very hot and don't bother trying to touch the transformer unless you
want to lose your fingerprints!

Do you want to laugh?
I have a FT980, which is very sensitive, but the QRN level at my QTH is awfull. So....sometimes, in order to be able to hear a station, I turn my old Hallicrafters S40B on. It has a fantastic noise limiter! Then I can hear my station!

> antenna with no dimensions!

As you said: Uhhhhhh - WR0NG !!!

A 1/4 wavelength monopole over an infinite perfect ground has about
5.1 dB of gain as is expected, 2.1 dB gain for that of a dipole (which
the mirror image via the perfect ground creates), and an additional 3 dB
of gain for the mirror image. The following NEC-2 deck readily verifies
this:

```
CE 1/4 wave vertical over perfect ground
GW 1, 20, 0.000, 0.000, 0.000, 0.000, 0.000, 0.250, 0.001
GE 0
GN 1
EX 0, 1, 1
RP 0, 91, 1, 1000, 0.000, 0.000, 1.000, 1.000
EN
```

A 1/2 wavelength vertical dipole over a perfect ground has about
an additional 1.6 dB of gain over the above 1/4 wavelength monopole.
Again, the following NEC-2 deck verifies this:

```
CE 1/2 wave vertical dipole above a perfect infinite ground.
GW 1, 41, 0.000, 0.000, 0.000, 0.000, 0.000, 0.500, 0.001
GE 0
GN 1
EX 0, 1, 21
RP 0, 91, 1, 1000, 0.000, 0.000, 1.000, 1.000
EN
```

In addition, this information is available in any good antenna
book under the description of a 1/4 wavelength monopole.

2m is line of site. Here in Denver we have repeaters that
range 120 miles, but they are 5000 ft. above plains. One fellow
hits it with full quieting with 30watts at 120 miles.

I've successfully sent and received packet with MIR at
284 miles with 5 watts and a 1/4 ground plane.

If you want more range, invest in a tower, not an amp.

Arghhhh!

First, learn how to quote. Second, read what Ed said. He said
efficiency and directional characteristics. If you think gain is
all there is to it, try using an underground antenna sometime.
They can be made to have a very good pattern but will generally
have very high losses. A Beverage is in the same category.
Pattern *and* efficiency are key elements when it comes to a
transmitting antenna. Together they equal effective radiated power.

Actually, that's not true. Most weak signal 2 meter work is done
using forward scatter which is normal propagation, not special
conditions. Special conditions (meteor scatter, aurora, Es, ducting,
etc.) increase your range from up to say 400 miles for well equipped
stations to potentially 1000's of miles.

But you are correct in that height is an important consideration as
is mode.

> As an example, I can reach a repeater about 140 km away with 4 Watts,

Jim,

Some of the 940's had 1 and some 2 batteries. This is a Kenwood mod. I have never gotten an answer to why. You should replace both. There is also another battery that maintains the memory you haven't found yet. The batteries you found are for the clock.

Remove the speaker housing and then remove the solid metal cover over the board under the speaker. The you can see the other battery. It is the one that maintains the memories. If it dies every time you turn on the radio it will come up at 14.000.00 mHz USB.

Space is not a problem on the paralled batteries so do whatever. The other one is a bit stickier so you may have to go to the stock battery. it can be ordered from the Kenwood parts dist. Part number W09-0326-05. (All three are the same number)

From: Jim <jstrohm@taxes.net>
Message-ID: <33E1A406.38E0@taxes.net>
Source record: 168924

The ERP on a set-up like that is high enough to cause some
problems with keying up multiple repeaters.

Here in Texas, a state crowded with 2-meter repeaters, we frequently
find the QRO stations are accessing two and sometimes three
of the .34/.94 machines. During the summer, if they're not
careful they can key up half the state -- and Texas is about the
size of Alberta, if I recall correctly. The solution,
of course, is to QRP to the real legal limit -- the lowest power
necessary to establish and maintain reliable communications.

In the SSB subband, you'll get some interesting results without
the problems of keying up five repeaters at once. With tropo ducting
in the summer, you should be able to work into all of Northern Europe
when the band opens. Under normal circumstances, you should have a
few hundred miles' range. On CW, you'll be just loud enough
that the big-gun moonbounce stations might be able to hear you.
Four stacked beams will definitely get you there.

But you really want to get your 13 WPM code! That way you can
work the world on 10 watts phone and a hunk of wire thrown over
a tree.

Aircraft use AM, the 79A is FM. As far as I know there is no way to
modify (easily) the Kenwood for A/C use. I have an Icom aircraft band HT
for use as an emergency backup while flying. I use my mobile rig to
check ATIS etc on the way to the airport.

The TR-7850/7950 are 12+ years old radios. The PL (CTCSS) unit usually is
an option to these old models and I am not suprised to see a new HAM
having struggles over a piece of optional accessory which is before
his/her time!

Com'on! There is no dumb question to ask. The dumbest question is not to
ask. Did you master this CTCSS thing the first day you encounter it?
Chill out, man.

Since I don't need anything fancy when mobile, I bought an IC-2000H just because it has a larger heatsink and hoping it would dissipate heat better. In fact, it seems to have the largest heatsink of its class. The thing still gets very hot to touch even after a moderate high power use.

Being feared of melting anything inside (or outside), I tied a 4" muffin fan on top of the heatsink fins. Now the rig really runs cool. Well, it is warm to touch even during very long, high power use.

I have a FT-8000R used as base, and boy isn't the heatsink small? The radio gets very hot even on low power, moderate chat. I added an additional 2" muffin fan at the back to help matters.

I believe almost all 50W mobile radios have a potential thermo runaway problem due to the size limitation! I just don't trust any of these mobile radio without a good size fan and heatsink. A $15.00 investment to give additional cooling your rig can go a long way. Unless you think $75.00 per hour labor plus parts and shipping (ICOM's rate) is just a drop in the bucket to you.

Maybe they are designed to run HOT!?

Hmm! :-)

I don't work for Kenwood, or have any financial interest in their company
at all (though I have bought a couple of their radios!)... that said, I
was operating the Field Day contest this year using a Kenwood TS-570,
which has DSP built in. The DSP unit on that radio abolutely *was* able to
pull signals out of the air, where none could be heard before!

> be much appreciated. I'll be most concerned with knocking down 10M
> and 2M.

The typical TVI filter is a high pass filter designed to remove
amateur HF signals. It won't do a thing at 2 meters. For
2 meters, the easiest thing to use is a band stop filter made
from a 1/4 wavelength of coax added as a stub to your feedline.
Insert a T in your antenna lead-in. To the T, attach a 1/4
wavelength piece of coax to the T and leave the other end open.
You need to take the velocity factor of the coax into consideration
when cutting the cable for 1/4 wavelength. A grid dip meter is
helpful in cuttin the coax to length.

Also, don't forget common mode currents which normal TVI filters
don't address. To help cure these, wrap the coax around a piece
of ferrite or make an open air RF choke by coiling about 10 turns
of coax in a 10 inch diameter coil.

> this at the beginning and end of each contact and at least every ten
> minutes during a QSO, you're perfectly legal.

My understanding is that what you have written is true, but it doesn't quite go far enough. When talking about cross-band repeaters, the repeating radio (your mobile rig) transmits on TWO bands (in this case, 2m and 440).

Each transmitter must identify itself.

When you use your HT (on, say, 440), your mobile radio (repeater) retransmits your HT's signal on 2m. When you ID (on the HT), you are identifying your HT. Because your signal is also being retransmitted by your mobile rig, that ID also identifies your mobile (repeater) rig... BUT ONLY ON 2m, as your mobile station is transmitting *only* on 2m at that time.

The problem is, that your mobile (repeater) rig also retransmits incoming 2m signals on the 440 band. To remain legal, your mobile (repeater) rig must identify itself on each band on which it transmits. Unless you can get your mobile rig to ID iteself on 440, it (you) are operating illegally.

As one other poster pointed out, this can be accomplished by switching your HT to 2m and transmitting your call... that way, your mobile rig will retransmit your HT's signal on the 440 band, and *that* ID will serve just fine as proper ID for the 440 side of your mobile's transmission.

A much more elegant method would be to have an automatic ID circuit build into the mobile (repeater) rig... hence the original question.

I would guess that especially since this is audio DSP you speak of, the noise you dug the signal out of was the sort that other noise blankers could deal with. Yes, I have had a Kenwood 440 in my car and could not hear any signals at all without the noise blanker engaged. I suspect a good DSP can also do that to some extent.

However, I was speaking of a weak signal at night on 10 meters, say. Dig one out of the white noise that a good "quiet" receiver cannot dig out on its own and I will be very impressed indeed. I have tried and tried, and my ears can always dig out the signal on either receiver. (I do know of other guys who have trouble hearing signals in the noise as well as I do, and for them the DSP gives them just enough boost to allow them to get the words, it just never happens for me.)

I have a friend with the 570, and I plan to go to his place this weekend to work that one over and try it out. I have used the popular DSP boxes, the FT 1000MP, the FT 920 and others without any impressive differences (but, don't misinterpret me, I like the DSP and it seems easier to listen with it on....)

>

I wouldnt bother with the amplifier- the gain is minimal with the
amount of money you'll end up spending on it. Best thing to do is get
a PAIR of 2 meter beams, and a decent rotor. An all-mode rig might
help- a good idea might be to invest in something like in IC-706mkii,
that way you can do 2M SSB/CW/FM, and when you upgrade, then you
can start using HF with the same radio.

2M, however, has one big caveat- if you are in a valley, don't bother
with any of the above, because you wont't get much better results than

you already have. You might want to get yourself a topographical map
of the region, to see whats "line of sight" from your location. -
Theres also no better time to either move onto HF, or start working
satellites, ,or a combination of both. (many satellites have uplinks
downlinks and such on many different bands)

Now Jeremi has a sense of humor !

A single frequency transmitter with a PLL..... :-)))

and Paul probably doesn't have a clue about crystals and multipliers.
:-(

I would recommend the Amateur Radio Handbook produced by the ARRL except
he would probably end up building a PLL based transmitter.... :-&

PAUL <-- get yourself a 9.458 crystal, then build an oscillator
followed by one doubler and two tripler amplifiers. Viola! you are
transmitting on 170.244 MHZ. A simple tweak of the oscillator tuning
capicator later and you are on 170.245 - sans modulation - cept maybe
some HUMMMMM if you don't have a stable power source..... :-)

Hello all,

Once again I'll be out Calling CQ on 50.400 AM

Sat and Sun..10:00-20:00pdt (17:00-03:00)z

I'll call CQ on the hour and on the half.

Last time I had a tree trimmer running his grinder all weekend.
Had too much QRM and s9 of ac type noise.

There were a few opening though.

Lets hope for a good "open" weekend.

If you want more details on the 50.400 AM test Check out my home page.
http://www.geocities.com/Hollywood/5860/50am.html

Also I'm running a Swan 250/60 watts/Vertical ar-6/

There is a lot of info there.

Thanks everyone!

Hi there
I was wondering if any of you can answer a theoretical question. Right now, I have a 50 watts 2 meters transmitter coupled to a Ringo Ranger ARX2B antenna and this setup gives me about a 75 miles range on FM using repeaters. If I added a 160 watts rf amplifier with a 20 db receive preamp and used a 13 elements beam with a gain of 15 db, what kind of range could I get on 2 meters FM using repeaters again? I know this question might sound silly but I wonder if it is worth it to upgrade my rig. If I can't get interesting performance with that kind of setup, I just might have to pass my cw test at 5 wpm and go to HF! I would like answers from hams who have tried something like that. Also, if I used this new setup with a multimode transmitter on SSB, what could be the range?

My friend was involved in an auto accident where his car rolled three
times, and he was thrown from the car. He was taken to the hospital
unconcious, and his car was totalled, taken to the junk yard. Although he
was perfectly fine, his car and radio equipment, he thought, were not.
When he arrived at the junkyard, he began removing all his belongings,
including busted up mobile rigs, etc. In the opened glove-box, there was no
FT50, where he had stored it. Upon his walking down the dirt road to exit
the place, there at the entrance was the JUNKYARD dog, knawing away at
something, On closer inspection, It was his FT 50. After carefully
extracting the radio from old JAWS, he saw the only thing wrong was a
chewed up antenna in need of replacement, and a few teeth marks on the case

bottom. The radio keyed up the local repeaters, and received fine.
After rolling over three times at 60 MPH, and having a round with
JUNKyard dog, this MUST be a tough l'il radio.

Source record: 168994

I went to HRO yeaterday to take a look at both the ic-756 and the Kenwood ts-570s. The thing that I discovered is that the display on the 756 is awful. I am legally blind and I couldn't read the display at all. I could read the one on the Kenwood. The person whom I was with has 20/20 and he couldn't read the display on the 756 no mater how we adjusted it. Thank God Kenwood has decided to build a radio that is helpful to the sight impared.

The RS wireless mike kit can be modified to transmit on 170.245.
Instructions on how to do this can be found in the book NOW HEAR THIS
by Winston Arrington and CRB use to carry it. The schematics Mr.
Arrinton discusses in detail are the same basic circuit of the RS kit.
BTW - The book gives schematics to modify a xmitter from 30-300mhz.

I have both the Comet SMA501 and the long SMA503. The Diamonds would not work, they did not connect properly. Strange, but I honestly believe the stock ant is as effective as the 503 (long rat tail). The short stubby 501 is cute and immensly handy but not effective. I live close to the repeater and it works fine for me with my VX1R and the 50 but not effective once out of the immediate area.

Source record: 168809

I bought a CT-30 adapter for my Yaesu FT-50. The CT-30 changes the four-conductor plug on the FT-50 into two jacks: a 1/8" "EAR" jack and a 3/32" "MIC" jack. Does anyone have information on the wiring scheme for these jacks? I would like to make a packet cable. I would assume that the jacks on the CT-30 were designed like the older, two-plug Yaesu/Icom/Radio Shack speaker microphones, but I don't have any information on those either.

If you have this information, please e-mail me as well as posting. Thanks!

Dick,

I have the manuals for the 301 and 305 plugins. I don't want to part with the originals, but I would be glad to copy them if you were willing to pay for the copies. I need a manual for the model 317 High Sensitivity FM/AM/SSB Monitor plugin (S/N 1196). If you have one of these, or could get one, I would swap even up for scope and preselector plugins.

The scope manual has 31 non-blank pages, and the preselector manual has 18 pages plus a fold-out schematic.

Let me know.

73,
Mike Harmon

Greetings:

Please accept this invitation to visit our Web Sites. Both are
constantly growing, and that is where
you come in. We need your input.

The first, http://www.kb8uyz.com/kb8tnq is the KB8TNQ Ultimate Amateur

Radio Page! and is
a great source for the Ham and even those interested in getting into the

hobby. With a plethora of
links and a "Site O' the Week"...(one selected by yours truly)
we hope you'll find this Site user friendly.

The second, found at http://www.kb8uyz.com/cmarc is the Central
Michigan Amateur Radio
Club Web Site. While this Site is primarily a "Club" Site, we do have a

"Trader's Page", which was
recently started. All postings to this page are FREE, so if you have
unwanted Ham gear, feel free to
check it out and help us get the word out.

Thanks for your time and we'll look forward to seeing you soon.

7-3,
Jim KB8TNQ

ok, here's the last word on cw...NOT!, but think
about it this way...

If you love amateur radio, then you embrace its
culture, style, history, and ambience...
that means code..it is the foundation of our hobby,

and it brings class to the hobby...every ham should be required
to move from no-code to a code ticket. This battle
will continue to rage, but those who love the hobby
will pursue code proficiency. Those who are happy with
a codeless ticket are no better than housewives who get technician
tickets just to autopatch with their ham husbands..
specifically, they have no real love for the hobby in their
hearts, it's just a convenience. Frankly, I want to share
my ham radio experience with someone who cares about it
like me. The sign that someone cares about the hobby is whether they
learned code.

Sorry to all of you who feel differently, but if you're serious,
then you learn code.

We are seeing now the death of ham radio as it is. In the future,
there will be a new kind of amateur who will look just like the
ham of 50 years ago. It will be the fraternity that used to exist.
Those who are active on 2 mtrs now will be just like cb-ers. In the
future,
2 meters will be unlicensed, and it will be basically cb radio. Do you
remember when cb was licensed???? So too will 2 mtrs go. The only ham
radio that will count will be that of the 300,000 to 500,000 worldwide
amateurs who are dedicated to doing the hobby right. They will be the
homebrewers, sat ops, and CW users...and indeed, cw will still be
popular among this group 50 years from now...

I have found, with our demo unit of the store, that if you "mesh" the antenna inside the cord between the telephone and the handset, it works pretty well ... this for inside the house use, etc., of course ... hard to find a phone outside!

| Subject: making money
| Date: Lunes 26 de Mayo de 1997 1:47 AM
|

Interrest by making $50,000 ?

HERE"S A FUN WAY TO MAKE SOME EXTRA CASH!!!! WHO KNOWS YOU MAY EVEN
GET RICH!!!!!!!!!!!!!!!!!!!!!!!!!!!!!You gotta be crazy! How on earth
do you think you can buy 50 grand for lousy 5 buck? Well, that's what
I was wondering, too until I came across this letter.First of all,
IT'S PERFECTLY LEGAL!(Call 1-800-725-2161) if you have any questions
about the following opportunity to make $50,000.00 and that probably
WITHIN LESS THAN TWO MONTHS!Well, here it goes:A little while back, I
was browsing these newsgroups, just like you are now, and came across
an article similar to this that said you could make thousands of
dollars within weeks with only an
initial investment of $5.00! So I thought, "yeah, right, this must be
a
joke," but like most of us I was curious, so I kept reading. Anyway,
it said
that you $1.00 toeach ofthe 5 names and addresses stated in the
article.
You then place your own name and address in the bottom of the list at
#5, and
post the article in at least 200 newsgroups. (There are thousands) No
catch,
that was it.I knew that that was the opportunity I had waited for a
long
time.I thought it was about time that the money of the world gets into
the right hands! OURS, right? I never had a doubt that this thing
will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a
try? As I mention before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out
with the US Post Office (1-800-725-2161) and they confirmed that it is
indeed
legal! Now, that's how your story WILL sound like, too if you
participate:Well GUESS WHAT!!... within 7 days, I started getting
money in
the mail! Iwas shocked! I still figure it would end soon, and didn't
```

give
it another thought. But the money kept coming in. In my first week,
I
made about $20.00 to $30.00 dollars. By the end of the second week I
had
made a totalof over $1,000.00!!!!! In the third week I had over
$10,000.00
and it's still growing. This is now my fourth week and I have made a
total
of just $42,000.00 and it's still coming in....Let me tell you how
this works
and most importantly, why it works...also,make sure you print a copy
of this
article NOW, so you can get the information off of it as you need it.
The
process is very simple and consist of 3 easy steps:STEP1: Get 5
separate
pieces of paper and write the following on each piece of paper "PLEASE
PUT ME
ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside each
of the 5 pieces of paper so the bill will not be seen through the
envelope to
prevent thievery. Next, place one paper ineach ofthe 5 envelopes and
seal
them. You should now have 5 sealed envelopes,each with a piece of
paper
stating the above phrase and a $1.00 bill.What you are doing is
creating a
service by this. This is perfectly legal! Mail the 5 envelopes to the
following addresses:

#1 J. A. Gang
970 Paces Circle #300
Apopka, FL
32703

#2 T.J. Kashin
2009 Hollyhock St
Pekin, IL 61554

#3 Fred Dufour
1596 39avenue
Montreal, QC
H1A4A2, Canada

#4 Robert Wisowaty
1341 Kane st.
La Crosse, WI 54603

#5 Adrian Silva
Tepozteco 102A
Cuernavaca MOR 62150

Mexico

STEP 2: Now take the #1 name off the list that you see above, move the other names up(2 becomes 1, 3 becomes 2, ect...) and YOUR NAME as number 5 on the list.STEP 3: Change anything you need to but try to keep this article as close to the original as possible.
Now, post your article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you
post, the more money you make!Don't know HOW to post in the newsgroups?
Well do exactly the following:**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!BUT YOU HAVE TO POST A MINIMUM OF 200****If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for non-commercial use.To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.**That's it! You will begin receiving money from around the world within days! You may eventully want to rent a P.O. box due to the large amount of mail you receive. If you wish to say anonymous,you can invent a name to use as long
as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**Now the Why part:This entire principle works because it is in a
format of an upside down tree with thousands of branches. Everyone below you
will see to it that the tree continues because they want to get money. Those
below THEM will continue because THEY want to get the cash ect.Out of 200
postings, say I receive only 5 replies (a very low example). So then I made
$5.00 with my name at #5 on the letter. Now, each ofthe 5 persons who just
sent me $1.00 make the minimum 200 postings, each with myname at #4 and only
5 persons responds to each of the original 5, that is another $25.00 for me,
now those 25 each make 200 minimum post with myname at #3 and only 5 reply each, I will bring in an additional $125.00!Now,those 125 persons
turn around and post the minimun 200 with my name at#2 and only 5 replies
each, I will make an additional $626.00! Ok, now here is the fun part, each
of the 625 persons post a minimum of 200 letters with my name at #1 and they
each receive 5 replies, that just made me $3,125.00!!! With a original
investment of only $5.00! AMAZING! And as I said 5 resonses is actually VERY

LOW! Average is probable 20 to 30! So lets put those figures at just 15
responses per person. Here is what you will make:at #5 $15.00 at #4 $225.00 at
#3 $3,375.00 at #2 $50,625.00 at #1 $759,375.00. When your name is no longer on
the list, you just take the latest posting in the newsgroups, and send out
another $5.00 to the names on the list, putting your name at number 5 and
start posting again. The thing to remember is that thousands of people all
over the world are joining the internet and reading these articles everyday,
JUST LIKE YOU are now!!And this will go on and on and on...get the picture?
Well, there's 5,000,000,000 people in the world and most of them will
eventully end up being hooked into the internet. So there are virtually
unlimited resources. Of course this will work the best at the very
beginning so the faster you post, the better for YOU!So can you afford $5.00
and see if it really works?? I think so! People have said, "what if the plan
is played out and no one sends you the money? So what! What are the chances
of that happening when there are tons of newusers and new honest works?? I
think so... People have said, "what if the plan is played out and no one
sends you the money? So what! What are the chances of that happening when
there are tons of new honest users and new honest people who are joining the
internet and newsgroups everyday and are willing to give it a try? Estimates
are at 20,000 to 30,000 new users everyday, with thousands of those joining
the actual internet. remember, play FAIRLY and HONESTLY and this will work.
You just have to be honest.Make sure you print this article out RIGHT NOW,
also. Try to keep a list of everyone that you sends you money and always
keep an eye on the news groups to make sure everyone is playing fairly.Remember
, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea
to make the money!!GOOD LUCK to all and pleas play fairly and reap the
huge rewards from this,which is tons of extra CASH. **By the way, if you try to

deceive people by posting the messages with your name in the list and not
sending the money to the rest of the people already on the list, you will not
get as much. Someone I talked to knew someone who did that and he only made
about $150.00, and that's after seven or eight weeks! Then he sent the 5
$1.00 bills, people added him to their list, and inn 4-5 weeks he had over
$10k. This is the fairest and most honest way I have ever seen to share the
wealth of the world without costing anything but our time!!! You also may
want to buy mailing ande-mail list for future dollars.Please remember to
declare your extra income. Thanks once again......

2837. Mod for YAESU FT-900

2838. FT50 ? How do you make the game work?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-02 00:00:00 UTC
From: Harvey Trautenberg <traut@bellsouth.net>
Message-ID: <33E3EFD0.4C08@bellsouth.net>
Source record: 168825

A trivial matter, but I can't get the game to work properly. I thing that after simultaneously pushing power and "MR" the numbers scroll and one is supposed to add the digit to its complementary number to equal 10. I try this but I always get score = 0000. (this even happens if I USE A CALCULATOR). What's up?

PS When I put in the number I get no addtional response from the radio. THanks and 73's. HT KF4SXT.

2843. Re: Cross band repeater operation

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-02 00:00:00 UTC
From: trneal@ix.netcom.com
Message-ID: <33e29269.530495@nntp.ix.netcom.com>
Source record: 168876

As several responders have said the problem is with the 440 MHZ link from the mobile radio back to the HT.

I can not understand why the manufacturers are putting out some many radios which encourage illegal operation in the cross band repeat mode. With all the options being built into new radios why dosen't even one manufacturer buildin an automatic CW IDer? On the newer Yaesu HTs (FT50, VX1R...), one of the options is ARTS which sends poll signals between two similarly equiped HTs to determine if they are within simplex range. Periodically the HT will automatically CW ID. How hard would it be to buildin the same type CW IDer for cross-band repeater operation?

Wake up HAM radio manufacturers!

With the new very small, very low power HTs now coming on the market, cross band repeating is very attractive. Its about time that we could buy a "off the shelf" radio that can operate legally in this mode.

Tom

2849. OMNI VI opinions solicited

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-02 00:00:00 UTC
From: jlbarber@wolfenet.nospam
Message-ID: <5run9n$8oj$1@sparky.wolfe.net>
Source record: 168882

Hi Folks,

I'm looking at buying a new HF rig, and am intrigued by some of the comments I've heard about the OMNI VI's receiver.

For the money, the rig does not have near the bells and whistles of the Japanese rigs, and does not have SWR foldback or forced-air cooling. (I'm an SSTV operator)

BUT, if the receiver is significantly better than say, the FT1000MP, or the TS870, I can do without the bells and whistles, and I can use the amplifier more than I have in the past to keep the dissapation down.

I'm not terribly active on CW, BTW, so QSK and great CW filters are not that high on the list.

Opinions ?

** Please swap the "nospam" in my email address to "com" for email
** replies.

> N9MWB

Thanks for your input, Todd. The NEC info must mean something, but I must admit that, although I understand what the software is supposed to do, I am illiterate in its use. Perhaps you could post or email me on the significance of the numbers.

Next, I must need to find the right "any good antenna book." So far, I have found references to almost everything else, but no hard number on 1/4 wave ground plane monopole gain, in any of the following:

1. Antennas, Kraus.
2. EMC for Product Designers, Williams.
3. Air Force Design Handbook DH1-4.
4. ARRL Antenna Handbook, 15th Edition.
5. ARRL Amatuer Radio Handbook, 1993.
6. Fundamentals of EMC, White, Vols 1 & 6.
7. ARRL UHF/Microwave Experimenter's Handbook, 1990.
8. Wire Antennas, Orr.
9. RSGB Radio Reference Book, Jessop.
10. RSGB VHF-UHF Manual, Jessop.
11. ARRL VHF Manual, 1st Edition.
12. Microwave Antenna Theory & Design, Silver.
13. Technique of Micrawave Measurements, Montgomery, Vols 1 & 2.
14. Microwave Transmission Design Data, Moreno.
15. Microwave Transmission Circuits, Ragan.

Without meaning to be sarcastic, could you suggest page and chapter of that authoritative "good antenna book"?

And lastly, another issue is rearing its ugly head in the last few posts. When I started this thread, my question assumed that the gain was measured at the maximum intensity point on the co-ordinate sphere. My supposition was that the vertical 1/4 wave monopole radiation pattern, which is symmetrical around the vertical axis (said another way; omni-directional around the horizon) (& everyone has agreed or not challenged this), had its lobe maximum just at the horizon (when viewed in the X or Y axis). But there has been variation in thought about the angle of elevation of the lobe maximum (sometimes called the "take-off" angle).

I have found info which shows that a 5/8 wave monopole "squashes" the pattern downward, placing its lobe maximum onto the horizon. And that a 1/2 wave monopole results in a takeoff angle which is large (like 30 degrees. So.....what is the take-off angle of the 1/4 wave monopole?

I'm told that RT Systems will have the software in about a month. My
guess is that is will not be sold as an upgrade, but as a stand-alone.
But I'm just assuming the worst on this!

From: markem@primenet.com
Message-ID: <5s3i48$b66@nntp02.primenet.com>
Source record: 168697

I'm trying to wire a cable and connector on a Shure 444D mike. It has a Hi/Lo Z switch on it (I need the Lo Z setting). It didn't have a cable on it when I got it (hey, the price was right) and I don't understand what connects to what. There are 3 wires coming from the element (Hi Z, Lo Z, Common, I assume) to the selector switch. I know the pin-out of the rig but I don't quite see how to connect the switch that the PTT button operates. If anyone has a wiring diagram for that dude, I'd sure appreciate it.

Thanks & 73... Mark AA7TA markem@primenet.com

2866. Preamp for Heil Mic on Icom radios

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-03 00:00:00 UTC
From: "Dale \"Squeak\" Porray" <ad7k@accessnv.com>
Message-ID: <33E56B4B.99C5F68B@accessnv.com>
Source record: 168701

Someone asked some time back if there was a way to use a Heil microphone, or microphone element, on an Icom radio without turning the mic gain way up.

The problem is that the Icom radios want to see more output from the microphone than do most other radios.

Someone else suggested that I might be able to provide some insight ...

I dropped a note to Heil Sound, and got the following information in return:

==========

Hi Squeak,

We're still working on them. This beta testing can be a real pain but we
want to make it right. We'll keep you posted though. ... Hang in there
Buddy, I'm on Bob [Heil] daily about it.

73
Todd
KB9NQM

==========

So it does look like the project will come to fruition sometime ... hopefully
soon!

2879. Re: ICOM 751, battery and CW filter questions.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-03 00:00:00 UTC
From: trinit69@idt.net.nospam
Message-ID: <trinit69-0308970858290001@ip198.lafayette.la.pub-ip.psi.net>
Source record: 168755

Check the batt voltage. If it is greater than 2.5 V, don't worry about it.

If it is below 2, then jump in a 3V temporary source, and change the batt
yourself.

If you mess up, then send the board to Icom for a new batt and programming.

Most likely it will be > 2V and not a problem.

73 Tom

Hello,

Anyone have experience with the Comet SMA-503 dual band antenna?
I am comtemplating getting one for my Yaesu VX-1R micro handheld.
Does it improve reception, over the stock antenna, on any band?

Thanks for any comment.

Jim...

Give RF Parts a call at 800-737-2787. They stock these modules. You may want to change the PIN diode also as they often go bad in the 7800-7850 series.

Good luck.. Dick, K7RNZ

I guess I don't know that antenna.

I have an SMA-501 (very short, definitely NOT an improvement) and an SMA-3 (very tall at abt 10") -- an improvement but kinda defeats the purpose of a tiny radio.

Note that I bought the SMAs above for my FT-50 (one to make it more compact for local work, the other for distant work when I am in the mountains). I would not have purchased either for the VX-1R.

The plug goes into the external speaker output of your radio and the jack is for the
speaker. No you can't use it on an antenna. This is a audio filter. I have 2 of them and
they are very effective especially for older receivers. DSP fitlers have taken over but
for CW the audio filter is ususally sufficient.

Source record: 168782

Most all of the manufacturers make 1.2Ghz amateur equipment, none make 900Mhz equipment. You will have to modify commercial 900Mhz equipment for the 900Mhz ham bands. Some 800Mhz stuff will also mod to 900.

Tom

Yo Ho:

Yes Dave, some cases do look hopeless and clueless. However, here we
have yet another instance of Ed posting a reply without counting to 10
(by ones) and before taking three deep breaths. I was a bit too direct
on him. He really appears to be a freshie. I have emailed him a couple
of times, explaining why I presumed him to be a precocious sub-teen, and
explaining some of the terms in the original post.
OTOH, he did tell me he DIDN'T really consult any dictionary; he just
felt that a dictionary would say that! Soooo, we now have a freshie who
fabricates quotes to support his opinions. And that's another whole can
of worms!

Saluud!

Ed WB6WSN

Well, it won't work long at 200 watts since it's designed for 130-150
watts input and in the neighborhood of 100 watts output (that average
not PEP).

Hello to all.
I'm looking for this little tunable FM transmitter (87-108 MHz)that
was made in the late 1960's by Kinematix, model number "IMP II".
It's 3 x 1-1/8 x 2-3/4 in size.
It's black and has a slide power switch on the front.
A microphone could also be plugged into the top. It was tuned
with a plastic tuning tool. This gem is in the 1967 Lafayette
Radio catalog for $39.95.
Does anyone out there have one of these at the bottom of a draw?
If so, and if it's in working order I'd like to buy it from you.
Let me know how much you want for it.
Please e-mail me direct
THANKS, Mark

NOTE If you want to E-mail me, you MUST REMOVE the NO.JUNKMAIL
in my address. It should read: mrusso@hoflink.com I'm trying to stop
the unwanted Junk Mail. SORRY for the inconvenience but it's getting
out of hand.

Always Available through Technology..... UNLESS SOMETHING BREAKS!!

I have a 386sx25 in a desktop case with svga color monitor, dot matrix printer, 8 megs ram,40 meg harddrive and mouse. Currently, it needs a keyboard. It has both 1.2 and 1.44 floppy drives. Asking $175 or will trade for a Viking Ranger, or Valiant.Other trades?? Call Mike, K7MH at 206-522-8654 in Seattle or e-mail K7MH@Juno.com or send reply. Thanks es 73.

2917. Yaesu Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-03 00:00:00 UTC
From: spoof@garbage.netrox.net
Message-ID: <870660606.3441@dejanews.com>
Source record: 168793

I have a question about the Yaesu FT-50. I have done the MARS/CAP mod, which I understand disables the ARS (Automatic Repeater Split). I have programmed a "custom split" into one memory slot as per the instructions that came with the radio. I now want to remove this split, and the manual says that when the main frequency in the memory "slot" is changed, the custom split will be lost. I tried this, and it doesn't erase the split. From the web pages I've seen, I havent come across any mention of this problem. Am I missing something or is this a legitimate bug? Either way, can someone let me know how to erase the custom split? Thanks!

Also: Is there any way to speed up the CTCSS scanning feature?

Please email:
Spoof@
garbage.
netrox.
net

Thanks!

Source record: 168828

Alan,

Heres' a MUCH better way... If one decides they WANT code, why not test and qualify for CW privileges and bands? Or, no CW endorsement, no CW Transmissions! It's That easy. If one has no desire to practice/send/copy code, why should they be required to pass a oppresive code test?

A licensee may later 'discover' CW and decide to pursue the privilege. Until then, why should he/she be denied the rest of the world of amature radio because they don't know code? We witnessed that code requirements was killing-off ham radio. With each passing year; our amatue radio ranks got smaller and smaller.

Today even the Cosat Guard has eliminated code testing requirements. I beleive it's international agreements that require code for HF ham bands and that, I suspect, is the only reason code is still required on HF. Truth is, folks have much better things to do than learn to pound CW!

Alan, face it, code is on it's way out. Just consider, what percentage of hams actually use it? The code requirement almost killed amature radio! No-code licenses, low priced tranceivers, Repeaters and crash courses saved our bands and hobby. The fact is, only a legion of licensed, active amatures will justify our need for spectrum!

One only needs to look at 220MHz, 27MHz and big blocks of other frequencies that were assigned to other services because there were not enough hams using them.

Now consider this, if you had a person standing in your shack who knew nothing of CW, how long do you think you could keep his/her interest in 40 CW? Maybe three minutes, tops?... "Oh,YEA!" "I REALLY want to do that too"! Yea, right!

As for your "brighter than others" theory, I know of three "Extra Class" amatures who can't use half of the functions on a simple volt-ohm meter! They can't set-up or use a signal generator or oscilloscope either! These same (and many other) Extra Class licensees have NO clue as to how to trouble-shoot and repair a simple full-wave power supply!

After passing my General, I've needed code only once to prove to some clown I could still copy and send it! Wow, think I got a woody! I copied code at 15 WPM! Whooopie! Code SUX.

I suspect there were thousands of technical persons (read computer-types) who would have LOVED to get into Packet when it first splashed on our radio bands a few years ago! We all KNOW it was CW that kept most them from our hobby. "Dumb" , unworthy people? Not hardly! Suppose some of these folks could have enhancd protocols and data transfer methods? So the 'smart' thing to do was ban them from airwaves? Well thank God for WWW... now they don't need us at all.

You old-school boys make me want to throw-up. Your "W1" call only serves to show that you are just another old crotch who whines when life, time, and technology is leaving you far behind! You same guys cried when we started converting FM business band radios to amature bands. What a shot-in-the-arm that was for two meters and UHF! "Boo-hoo, it's gonna' be another Citizens Band", the old crotches cried....

My point is simply this: I would venture to say that 95+% of hams will never be able to service most of the modern gear we use! Once opened up on the kitchen table, most hams wouldn't have a clue where to begin to trouble-shoot. I venture to say 20% won't even reassemble the radio, they will just but it in a box or a bag! Does all this mean only 10% of us really deserve our license?

Alan, I think it's time we retest ALL "K"/"W"/"WA" licensees! Let's make certan that they all know the 'newer' technology like satellites, ATV, Packett Protocall/Operation. Let's include solid-state theory, application and random trouble-shooting of transmitters and receivers! Oh, lets not forget SMT technology and programable tranceiver theory. How about phase-locked-loops, switching power supplies and multiplexing?

Or how about a simple (read stupid) rule like, if you MUST be certified to service and maintain ALL of the equipment you intend to use before you will be issued a license to operate the station? I firmly beleive demanding CW of us is just that stupid.

And Alan, I fully agree with you... we SHOULD give licenses to ALL citizens! Pass a reasonable test that includes equipment operation, proper tune-up, basic antenna requirements, basic 'rules of the road' and that's it! Hand them a license, authorized band list and let them enjoy the spectrum that belong to them! Very similar to a drivers license! Why should it be any tougher than that?

Should your mother need to know how to set timing and points to have her drivers license? How about valve adjustments or a full-on tune up? The archaic code and heavy theory requirements make about as much sence.

Consider a classic sixteen year old who has just earned her first drivers licensee? Within minutes she can lawfully be alone, on the highways with a real possibility of causing death to herself or others! That's damned serious! I also want to point out that she

exactly the same privileges a veteran driver of ten years has. She is licensed to operate on any public road. So why then must a ham radio license be any tougher than that?!

In closing, in invite you to simply copy the CW in the background in any movie and what do you get?... Garbage! Poetic too because after all, it WAS the Brass-Pounders who invented: 'duh' 'duh' 'duh' 'duh' 'duh' 'duh'... their mantra(!)... after all, it's a whole way of life for them... only fitting that it equates decodes to zero.

WOW!

Here's what I recommend...

Start with a new 'ground rod', as close to the radio as you can get,
even if it means drilling a small hole thru the wall. Assure a short
wire from the rod to the transmitter.

Wet the ground around the rod for a few weeks.

Install a antenna tuner and always tune carefully.

*HAVE A ELECTRICIAN:

* Inspect the ground 'rod' and all junctions provided for the Power
Panel. Assure tight, clean connections!
* Clean all ground connections/junctions inside the Power Panel.
* Tighten all ground screws in the Master Panel.
* Test ALL outlets with a small neon outlet tester (about $5).
+ Assure proper connections and grounds.
+Correct any 'miswires'.
* Assure TIGHT coax connections at VCR's, Antennas, TV's, etc.
** Replace all outlets to three wire outlets. (last option)

That's a good start!

2924. SWAP LASER PRINTER FOR TUBE TESTER

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-03 00:00:00 UTC
From: l.mclaughlin@popmail.csuohio.edu
Message-ID: <5s0r3o$mbt@csu-b.csuohio.edu>
Source record: 168831

SWAP HIGH END NEC LASER PRINTER FOR HICKOK TUBE TESTER, for example, 752, 752A, 539C, TV-7D, TV-10, B&K 747, TRIPLETT OR OTHER DYNAMIC MUTUAL CONDUCTANCE TUBE TESTER, ETC.

NEC Postscript Silentwriter LC 890 Model, 8 PPM, 2 MB Ram, 300 DPI, backlit two character lines LCD option menu screen, external print density control, dual letter & legal sized paper trays, dual printer ports (PC or Mac compatible)--same as the HP Postscript high end office model that's about $1200 right now and the only difference is the HP is 600 DPI. I can't tell the difference between 300 & 600 DPI. NEC NEEDS MINOR REPAIR.

IF YOU HAVE A HICKOK OR SIMILAR UNIT THAT YOU WOULD LIKE TO SWAP, LETS COMMUNICATE. Incidentally, to add the Postscript option with all those nice Adobe fonts to a basic laser printer usually adds $200-$400 to the base price of the printer (licensed Adobe fonts and extra memory required--these Adobe fonts are not in the Windows True Type fonts, but show up only when you have this Postscript printer listed with the ability to print them). Hopefully, you'll be in the Ohio (northeast area) so you can inspect it in person to avoid shipping costs for both of us. It's heavy and not a cheap light duty type printer.

You can email me directly at:
l.mclaughlin@popmail.csuohio.edu

Thank you

Hello Om,

I am very interested in working with 9k6 packet with the TM-V7A and the
TNC2H from Symek.
How is it working?
Do you know the best way of the dipscwitches 5-9 on the front?
Is this the best 9k6 packet combination?
Please, if you know more, let me know.
Best 73,

Harry PA3CWQ

Can't help wondering, do you suppose the level playing field on 11 meters as opposed to the "us vs them" in the Ham world has anything to do with it? (read the class system).

Well according to the book that the ARRL publishes on FCC part 97
rules, a crossband repeater is considered a remote base and the UHF
transmissions must be IDed. I don't know if the couple paragraphs in
their book are directly copied from FCC part 97 or not.

Circuits on packet

Hi all, Ron (G0TLA) has spent a couple of weeks here
in Sweden fixing up my own QRP PMS (Personal Messaging
system) on the packet radio. My site is a mirror of
Rons PMS from which you can download loads of circuits
for antennas, transmitters, receivers, etc. The packet
address of the two PMSs are:

G0TLA @ GB7NND.#23.GBR.EU
SM0VPO @ SL0ZS.KISTA.AB.SWE.EU

Again; NO fees, memberships, registration or any other
impediment is required. All files can be automatically
by ANY licenced radio amateur.

To access, send the following packet message:

To request DIR of files or directories

Command: SP REQDIR@G0TLA.GB7NND.#23.GBR.EU
Title : QRP @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

or

Command: QRP REQDIR@SM0VPO.SL0ZS.KISTA.AB.SWE.EU
Title : QRP @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

To request file (example QRP/ANTENNA/70CMJIM.GIF)

Command: SP 7PSERVE@G0TLA.GB7NND.#23.GBR.EU
Title : QRP/ANTENNA/70CMJIM.GIF @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

or

Command: SP 7PSERVE@SM0VPO.SL0ZS.KISTA.AB.SWE.EU
Title : QRP/ANTENNA/70CMJIM.GIF @ [insert your own bbs here]
Message: /EX (or Ctrl+Z)

You can also find loads of files and even pictures of
finished projects at:

http://user.tninet.se/~acz732k/
http://hem2.passagen.se/sm0vpo

Best regards Harry (SM0VPO) and Ron (G0TLA)

2939. Opion? Alinco DX70 vs. Icom 706mkII vs. Yaesu FT900

Thanks in advance for your thoughts and/or experience. I'm looking for a second rig, (FT-1000MP at home). I'm interested in a rig to take camping in an RV, and to use occassionally in the truck. CW is a must, with some SSB on 40 and 80.

As I live 5 miles from NYC, paging intermod problems are a real possibility and scare me away from the 706mkII. Besides, 2/6 meters are not a great interest at the moment.

The Alinco DX70T(H) sounds perfect, but I've had NO experience the company. I had a Yaesu FT890 and loved it, so I'm also thinking about a FT900, but it seems to me that it's nearing the end of its' life cycle. The size of the Alinco DX70 and Icom 706 would be a real plus in the truck, but not essential.

Any thought would be greatly appreciated.

Thanks and 73,
Thom KI2N

I am having a problem with some Visars in part 91 operation. I thought I would ask among hams that are either using the Visar handeld for ham ops - or perhaps some of you work with them professionally.

Is any experience audio problems with UHF (450 MHz) Visars? We have a number of them that are transmitting really dirty audio. They are within limits on deviation but they are so noisy that sometimes you just can't understand the person transmitting.

I have contacted my Motorola rep. But as of yet he has not found anything on known service troubles on the Visar audio.

Respond by e-mail if you wish.

Thanks.

Don't EVER sell it! It's a really rugged rig, no intermod problems,
and you'll kick yourself if you do sell it. I know; sold both my
IC2GAT and IC4GAT to buy a dual-band ht. Regret it to this day. If
it works, and you really don't need the money, keep it as a back-up.

:Hi Chuck,
:
:On Thu, 31 Jul 1997, Charles W. McMullen wrote:
:
:> The FCC DOES NOT require that repeaters (or any other station for that
:> matter) identify automatically. This is normally done with repeaters
:> to take the burden of sending the repeater ID of f of the user. If your
:> call sign is W3XYZ and you're operating through your mobile rig running
:> as a crossband repeater all you have to do is Identify as such by saying
:> something like "This is W3XYZ via W3XYZ repeater." If you identify like
:> this at the beginning and end of each contact and at least every ten
:> minutes during a QSO, you're perfectly legal.
:
:My understanding is that what you have written is true, but it doesn't
:quite go far enough. When talking about cross-band repeaters, the
:repeating radio (your mobile rig) transmits on TWO bands (in this case, 2m
:and 440).

You are quite wrong there.
When using cross band repeat the mobile set transmits only on ONE band.
Whether you use cross band repeat between two HTs or between HT and
repeater the mobile set receives on one band only and TXs on the other
band only.

:Each transmitter must identify itself.

That is done when you identify on your HT. The HT is identified and
the ident is relayed by your mobile set.

:When you use your HT (on, say, 440), your mobile radio (repeater)
:retransmits your HT's signal on 2m. When you ID (on the HT), you are
:identifying your HT. Because your signal is also being retransmitted by
:your mobile rig, that ID also identifies your mobile (repeater) rig... BUT
:ONLY ON 2m, as your mobile station is transmitting *only* on 2m at that
:time.

Quite so.

:The problem is, that your mobile (repeater) rig also retransmits incoming
:2m signals on the 440 band. To remain legal, your mobile (repeater) rig
:must identify itself on each band on which it transmits. Unless you can
:get your mobile rig to ID iteself on 440, it (you) are operating
:illegally.

You do not understand how cross band repeat works. It is a one way thing
only as far as the mobile set is concerned.

:As one other poster pointed out, this can be accomplished by switching
:your HT to 2m and transmitting your call... that way, your mobile rig will
:retransmit your HT's signal on the 440 band, and *that* ID will serve just
:fine as proper ID for the 440 side of your mobile's transmission.
:
:A much more elegant method would be to have an automatic ID circuit build
:into the mobile (repeater) rig... hence the original question.

If you understood cross band repeat you would see that it is only
necessary to ident on your HT as normal.

Barry

Robert:

I am crazy about my TS-870S. It's a great rig. I've had many
Kenwoods, as far back as a TS-520S and TS-440SAT, and more recently
the TS-940SAT. In my opinion the receiver in the 870 is just as hot
or better than in the 940. It does take some getting used to and
I really wish there were more intermediate settings on the DSP, but
all in all, it is a great rig and good value for the money, IMO.

Thinking about getting one?

Regards,

Dan

LMR vehicular rptrs do NOT operate under Part 97 but rather Part 90..
the rules ARE different for them than us...(I know...I was a telecom
tech for a public utility that used uhf to lowband crossband mobile
rptrs at my suggestion....when we filed for the UHF license, the
rules stated the HTs did not have to ID the crossband rptr callsign..
only the mobile callsign of the lowband side...which was KA3236..the
lowband bases had separate calls...the UHF side was limited to 1 watt
max! Not 10 or more as some amateur use)

Additionally, a pilot who just wants to fly in clear weather only needs a private license (kinda like talking on a radio), pilots who want to fly in all weather need an additional rating Instrument and must maintain profieciency every 6 months (like in those who want to use code, except for the proficiency part), so why not in Amateur service? A real license in the past was the Radio Telephone Operators permit or "1st Phone". For those who use it for the majority of it's restrictions, it was all that was needed. But, if you specifically wanted to work on Radar, you needed a Radar endorsement. A Code endorsement is a great idea, for use in the code portion of the bands. And proficiency is another idea in this area. I know several amateurs who learned the code, or higher code speeds, just for the additional phone portions of the band. Most, who never used code since, cannot copy 5 wpm any more, so by some peoples comments on this issue, they should be banned from the "real hobby". I took a Technician class test almost 20 years ago, had to learn 5 wpm code, couldn't even copy it today. Yet 8 words a minute of code keeps me from most of the HF portions of the ham bands, something I have no interest in, but if I ever even thought about it, I would be interested in Digital or Single Sideband operations only, and CW is not something that would ever be dreamed about. The lack of technical ability is what worries me, not someones ability to copy code. There are extra class repeater operators around here that have know idea how their store bought repeater works, they are more concerned about how many beeps and bops they can have from their store bought controllers. And yes, there are some just as stupid no-code types, and Tech Plus types, and all other types, but morse code is not, and never has been, a stupidity filter. A tune through the 40meter band confirms this. But also being in the very competitive 2 way and common carrier business, playing auction games, spectrum and license freezes, etc. etc., everyone better start rethinking their priorities, cause the big money is out there, and they see a lot of unused, or poorly used spectrum, including HF, and it is in the crosshairs. And the ARRL is a pissant on the wart of the Motorola,s and Nextel,s, collective butts, and as such can be swatted off with little effort.

A crossband rptr is a rptr....unless it is REMOTELY controlled...
(Remote bases do not appear ANYWHERE in Part 97..)
A remotely controlled station may NOT be automatically controlled..
a rptr may....so 99.9% of the time, the crossband system is a rptr...
unless you can shut it down via RF, etc immediately...

Cross band repeat comes in two flavors. "Uni-directional" and "Bi-Directional". I would guess that in the situation you are adressing, Bi-directional is the most common mode. HT keys up on UHF, Mobile Repeater (in Bi-Directional Mode) receives the UHF signal and rebroadcasts it on a selected VHF frequency. So far so good, but how does your UHF HT listen to the response from the VHF side. Well the Japs figured that you might want to hear the response so they have the radio stop transmitting on VHF when your HTs UHF signal goes away (brilliant idea, prevents a lockup). At this point your mobile now receives on VHF, and retransmits the VHF signal back to your little UHF portable by means of the UHF transmitter in the mobile repeater. This is the whole idea of the cross-band repeat functions of most ham rigs so equipped. It can and has been a problem. Somebody decides to do this with the local 10-4/24 2 meter repeater and picks a "unused" UHF freq for the HT to mobile link, say 440.5. Unfortunately, Mr. repeater maker, without benefit of the frequency coordinators wisdom, just choose a remote reciver link frequency for a popular repeater. Now, mr mobile repeater maker ties up a repeater he knows nothing about, and is 100 milliwatt UHF portable may not be strong enough to reach the link receiver, so the folks are at a loss as to who is doing this wonderful thing, hence one possibility as to the desire, if not regulatory need for ID by ALL the transmitters. It happens around Columbus all the time. Thank God for DPL!

You can easily do that....PBX ckts are done all the time that way via
4wire E&M Tie trunk cards.....Rptrs can use the same cards for
4wire full duplex links with E&M signaling doing COS and PTT functions..
I have done it before....
(DS0 voice channels on a T1 are 64K with some bits used for signaling)

On the other hand, Yaesu could sell the ADMS-1 in its several different versions ... Version ADMS-1 for just those who have an FT-530 ... ADMS-1B just for those who have an FT-51, ADMS-1C just for those who have an FT-10/40/50, ADMS-1D just for those who have a VX-1R ... and not include all the previous files in it ... when you get the ADMS-1D, it will include not only programming capability for the VX-1R, but will include all previous files as well.

I'm not saying that anyone in this thread is "right" or that anyone is "wrong" ... just presenting a different perspective on the situation.

They do use this methodology in testing pilots. Commercial Pilots are always in continuing Education, not on a Ford Tri-Motor but an M80 or newer Aircraft. I think re-testing is a valid point. Why not retest HAM's when it is time to renew there license on current technologies. I imagine many will have no problems at all with this.

Unless he is using the new ICOM, or either of the SGC radios which are
also type accepted for both marine AND amateur bands, or maybe he is in
Civil Air Patrol, which is outside the amateur band also. In any of these
cases he is still getting a "great start", which in this day and age is
doing anything that does not involve watching TV.

> band only.

Ahh YOU donot understand how a crossband dualband mobile CAN operate..
My TM742 CAN and DOES crossband from UHF to 2mtr AND back again when
a signal on 2 appears...it repeats it BACK to UHF....
YOU ARE talking about ONE WAY...MOST dualband rigs will do TWO WAY cross
band rpt...
>
> That is done when you identify on your HT. The HT is identified and
> the ident is relayed by your mobile set.

Again, the UHF TX rpting 2mtrs back TO ME is NOT legally IDed unless
it has a CW id hooked to it OR I key up on 2 and ID the UHF TX myself
(provided I can get into the 2mtr side)...

>
> You do not understand how cross band repeat works. It is a one way thing
> only as far as the mobile set is concerned.

Again, you are wrong....but wait...you have a foreign email address??
This question was concerning US amateur operations....its different
overseas..

>
> If you understood cross band repeat you would see that it is only
> necessary to ident on your HT as normal.

IF you had a dualband radio, you would see that what the previous
poster said was 100% correct and you are talking about ONEWAY crossband,
while the rest of us are talking twoway half duplex crossband..

2978. The greatest thing in Amateur Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-04 00:00:00 UTC
From: John <john@qsl.net>
Message-ID: <33E674CA.474935AB@qsl.net>

I have read alot here about code vs no-code.

Yes I am new to ham radio. No I did not have to learn CW. My first QSO was on 2 meters. It was a good experience. Thanks go to Skip and Brian in New Jersey.

I learned morse code on the Internet.

I tried it out on the air. Now I am hooked. The CW operators on 40 meters are the nicest people I have ever met.

The greatest thing in Amateur Radio is operating CW and the people I have met there.

Does anyone out there know which wire to clip or what the mod is for
making the IC707 Transmit out of ham band limits for (MARS) operation?
Any textual info would be appreciated via email.
Tnx and 73's
Joe

>between the ant. and radio instead? Thank you. Ray

The Autek QF1A is strictly an audio filter. I would imagine putting RF through it would burn just about everything up in it.

I have an original "Instruction Book"for a Collins 75A-3 Amateur
Receiver. It is in VG to EX condition with the registration card
still in the manual. The publication date is April 15, 1954.
I got it with my 75A-3 in about 1958. Wish I the radio rather than
the manual.

Will ship to best offer.

Please email hilandd@juno.com for more info.

Have to agree with Squeak -- I've always found AM reception to
be vastly improved when winding a telephone cord a few turns around
the radio. Either cord works -- from handset to phone, or from
phone to outlet. Most "twisted pair" is 4 conductor wire -- 2
used for the phone and 2 unused (unless multi-line system, pabx
etc). The unused wire makes a great receiving antenna -- wrapping
it around the radio itself if the radio has internal loop antenna
really boosts reception.

regards,
Joe

It is simple Steve and I will post it for you.

Pack radio in original packaging ship to Yeasu with a copy of your MARS
license. At Yaesu they will change the CPU and/or EPROM and return it
to you all modified.

That's straight from the horses mouth Steve don't be postin' no Bull.

Source record: 168715

Hi,

I've been a Ham for several years, but haven't been active for awhile. I have decided to find myself a 2 meter mobile rig and get going again. Problem is, I only have experience with the Yaesu stuff--and that's several years ago. I know ICOM & Kenwood make some good stuff, but I'm not familiar with any model numbers. I need some help here...

I need a basic 2 meter rig like the Yaesu FT-24. I'd prefer to find a good used one, and then buy another new rig for my other vehicle after I relearn "the ropes." I don't really need 440cm stuff--it's not too popular in my area. Also, I figure it'd be cheaper to go with just a 2 meter rig right now. Anybody have any suggestions??? Help is greatly appreciated...

All,

I have just purchased the new VX-1R on impulse. I could not resist it's size and features. A real first for Yaesu! Anyway, I would like to here all comments/tips on this radio. I normally research such equipment before making a purchase. This time I just did it!!!

My first though it it's lack of RF power. I live 20 miles from a metro area (Sacramento), in foot hills. I guess repeater access will be really limited. My second though is about lack of DTMF. well, it seems to have the ability to preprogram DTMF but not figured it out yet. Seems like it might be a bit difficult to access.

Please forward any comments on this tiny marvel to the group AND my e-mail

Thanks

I had the same question. I will be calling Yaesu tomorrow. I feel it would be unfair for them to charge me for the complete product. In fact, if they do, I will NOT buy it or maybe I should get an "eval" copy for extended use!! No, really, I will ask tomorrow, if they have any customer preservation strategies they should offer a free or Inexpensive upgrade!

We have now added several new things to the KB8UYZ Amateur Radio Page.
We now have over 400 radio mods online, an updated amateur radio news
section, and a new amateur radio rig review page, which will be updated
soon!

You can visit our site at http://kb8uyz.com, and please let us know what
you think of the site.

COMING SOON!! Amateur Radio Web Site Redirectors!!
Are you tired of your old url? Is it too much work to give out your
full url on the air or write it out in an email message?

Well, we will be offering amateur radio web site redirectors very soon!
You will be able to access your web site via kb8uyz.com/yourname, where
your name can be anything you want, such as your callsign.

We will post the sign-up form online when this feature becomes
available. Visit our site soon for more information!

>Giovanni Santin -- mc6164@mclink.it

Giovanni,
This sounds like a known problem with many Icom models of that
vintage. Plastic trimmer caps were used in the PLL section and sealed
with wax. The caps deteriorate with age and react with the wax. The
fix is to replace the plastic trimmers with ceramics and re-align the
PLL. Try a phone call to Icom service, they may supply the caps
without charge.

Good luck, Greg K3EWZ

Well,I don't know how the short ones work,but the 2 meter whip I made
for my Standard C510 blows ANY antenna I have away except for the huge
radio shack telescoping job.The SMA connector is about 7 bucks and the
whip is about a dimes work of spring wire(from a hobby shop),along with a
short piece of plastic tubing(about another dime!)to add sfiffness at the
bottom.The only real drawback is the length(app 19"),it's so thin and
light it doesn't really affect the HT's portablity.It's better on all
bands than any duck by far!

3000. New powersupply for Drake L4B

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-04 00:00:00 UTC
From: Frits Jensen <fj@sni.dk>
Message-ID: <01bca0ca$791098a0$590fd495@FJ.sni.dk>
Source record: 168726

I have a L4B still going strong with the original PS4 supply witch gives 2700 volts, 2400 keydown. That gives me about 800-900 watts out.

I'm thinking of building a new PS with higher voltage to give some 1200w output from the tubes.

Anybody know of a site with a solution, or anybody actually built one? Any advise will be appreciated.

Best 73 de OZ2Q - Frits - in Wonderfull Copenhagen

Greetings to all!

I have the following vacuum tubes for sale to whoever makes
me the best cash offer for them. I bought a couple of small
estates recently and these tubes were part of those estates.
I kept what I needed, and the rest must go.

Here are my sale conditions:

- Buyer must take them all as a lot, no separate sales.
- Buyer must pick them up in person at my home, which is
about 30 miles north of Dallas, Texas.
- Buyer must pay me in cash.

The ones under the "TESTED" header were tested by me using
my Sencore Continental MU-150 tube tester. The rest of them
are untested - I simply ran out of energy and desire! :)

The list is below... look it over... make me an offer!

73,
Dean K5DH

> > >>

Since the mid 80's I operated a 1 1/4 to 2 meter link using an Icom 3AT
and 2AT. To control and communicate
with the link, I used a second 3AT. The 3AT/2AT was linked together
using a digital control "black box" that
had a automatic ID'er, time out and audio circuits, and frequency
control. The 2AT had a rear mounted D25 FM
connector that mated with a D25 M on the black box. When 000 MHz was
selected on the 2AT's thumbwheel switch,
full frequency control, via the black box, was possible. The 1 1/4
meter side used a simplex frequency with
vox operation in both directions.

Last year I replaced the link with an Icom 2700 and using 70cm, I have
similar capabilities. I'm
working on a new black box that will include an auxilary receiver and a
duplexer for full duplex on 70cm, an
automatic Ider and DTMF decoder to control the receiver. The receiver
will interface with the 2700.

3006. Deleting/overwriting VX-1R Memories

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-04 00:00:00 UTC
From: al@alsplace.com
Message-ID: <al-0408970906490001@206.28.74.68>
Source record: 168732

I have a VX-1r with software version A105. There's nothing in my manual that mentions how to delete a memory contents, but I've found that the following works every time:

TO DELETE A MEMORY'S CONTENTS:

PRESS: F (1 SEC) -- till the F blinks

SELECT MEMORY NUMBER TO BE DELETED -- if it contains any data it will be blinking

PRESS: M/V

Contrary to what I've read on this group I've been able to over-write existing memories from other bands.....SOMETIMES...(BOTH ODD AND EVEN NUMBERS)......but I haven't established a pattern as to why this happens. But you can delete any memory -- from any band -- and that memory becomes available to any other band.

If I can't over-write a memory with new contents, I just use the procedure above and then save the new freq to the channel #.

Anyone else found any quirks, undocumented features, tips, etc for the VX-1R?? Email me with them and I'll compile a digest for all contributors as well as post to the newsgroup.

Thanks, 73 de AD4ME, John

From: al@alsplace.com
Message-ID: <al-0408970929570001@206.28.74.68>
Source record: 168733

I now see that the manual calls this procedure "Memory Masking." It works fine used as I've stated.....AND....after you've deleted (oops, "masked") a memory, that channel will show up as the lowest available memory location when you are trying to save a channel on any band (assuming it is the lowest, of course).

I think a better way to think of this feature is as a memory delete function. There is also an option to undelete a deleted, er masked, memory assuming you haven't overwritten it while it was "masked." -- You just do the masking procedure again.

This seems to solve one of my major gripes with the rig.

Thanks, 73 de AD4ME, John

Or better yet, allow the unit to scan at the fast rate until it detects a
carrier squelch break. If CTCSS decode is selected on the channel, have
the scan pause just long enough to test for proper tone. If the tone test
fails, the receiver would remain muted and the scan would automatically
resume. This would give you fast scan as long as no signals are present
but still allow CTCSS decode to function properly.

Source record: 168739
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.swap

Now that the radio has been around for awhile, what do the owners of the Kenwood 870 think of them...? Are they worth the $2300 price tag?

How does the quad conversion receiver do with the built-in filtering?

Opinions appreciated. Please reply here in the News Group...I've been having some problems with my e-mail.

Thanks.

Robert

3015. TS-930S Main Tuning Operation Question

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-04 00:00:00 UTC
From: remler@ll.mit.edu
Message-ID: <remler-0408971053390001@macbayliss.atc.ll.mit.edu>
Source record: 168741

I just obtained a very nice 1985-vintage TS-930S. Everything works great, except I can't figure out if the main tuning knob is supposed to work the way it does. According to the manual, the tuning knob is supposed to kick into a fast-tuning mode when you spin it; otherwise the tuning speed is pretty slow -- a few kHz per revolution. On my TS-930S, the tuning speed is always slow, even if you give the knob a very fast spin. Makes for a very slow traversing of a band! Not only that, but the rig seems to tune somewhat erratically -- sometimes jumping backwards a few kHz in frequency when reversing the tuning direction. Surely this isn't normal. How's is supposed to work? Any ideas on how to fix it? Reset the microprocessor (how do you do that?) Remove the backup batteries and let the rig discharge for a reset? Or perhaps it's got something to do with the optical encoder. Gad, what a can of worms. I checked with Kenwood service bulletins and they don't mention anything about this problem.

Anyone?

Hello All;
I'm selling a brand new still in the box Yaesu G-800S rotor &
control box. Also included is the Yaesu Warranty registration.
Braking torque:289ft-lbs, Rotation torque:43.5-79.5ft-lbs, Max
Vertical load: 440lbs, Wind load area:Tower/mount less .45m2 &
Mast/mount less 2.2m2 Mast Diameter 1-2inches, Rotation range
450degrees +0/5. Other details will be detailed via telephone.
Reason 4sale is: I'm using an az/el rotor for satellite work.
New it costs $389.00 I'm asking $280 + shipping OBO
All cash offers will be considered..
My phone# is: (609) 386-9382 but sorry it is busy most of the time.
You can try though anytime from 10am to 10pm ET..
Or RE: via Email to: n2rif@amsat.org

Nope. You have to contact RT Systems in Huntsville AL (1-800-723-6922)
$20 upgrade fee.

>
> 2) Is the FT-50R software similar to the FT-51R software ?

Looks the same but is different. Many other things to set.
>
> 3) Can you buy the FT-50R software seperate for Yaesu?

Nope, You need the upgrade kit. New software and a Cable for the Ft-50R.
works slick!

>
> 4) Does anyone want to trade an original copy of the FT-11/42/51R
> software for an original copy of the FT-10/40/50R software?

You would not want to do this as you still need the cable. They send you
a adapter that plugs into the old cable and has the 4 pin plug.

3025. Pointer to Ham Radio.FAQ

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0508970408270001@wd1v.mv.com>
Source record: 168601
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.dx,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.swap

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

73,

3026. Re: Amateur Electronic Supply goof not isolated event

Even so, check your bill. AES overbilled me $5 on an accessory, and added $1
to the bill for no rational reason. They didn't charge me the price that we
verbally negotiated. I'll assume that it was a snafu, but always check the
catalog, or web site to make sure that the clerk offered accurate pricing.

Source record: 168604

Bill,

Good info. that suggests there may BE an upgrade for the VX-1R, question in a different thread. BTW -- the FT-50 cable should work with the VX-1R, since they use the same speaker mike.

Phil

3035. Mobile Antenna Got Stolen

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: David Ho <davidho@one.net>
Message-ID: <Pine.LNX.3.95.970805123045.16170A-100000@shell.one.net>
Source record: 168611

Yesterday, some lousy idiot, stupid jerk, a**hole, and f**ker, stole my mobile antenna when my care was parked at a garage downtown Cincinnati, OH.

This kid is lousy because he stole a quarter wave antenna. This makes the jerk looks very stupid. Furthermore, stealing the rusted mag mount by cutting the cable makes this idiot even cheaper than dog sh*t! The chicken sh*t had no gut to break the window and search for my mobile rig. Hark!

Well, life goes on without my once beloved 1/4, and it's time to bite the bullet. What's good to mount a 5/8 2m antenna on my Mazda MPV? I don't want to drill holes and I need something that can be folded over for parking downtown. I thought of a hatch nack mount but that requires me to get out of the car every time I enter the garage. Kinda inconvenience... Does anyone have experience with those "Gutter Mounts"? Are they any good, mechanically speaking?

Best 73!

de David Ho, AF4BH (VS6UE/4)

p.s. I won't park in that garage anymore. I hate to run into this human garbage again.

The real issue here is why should you have to purchase the interface twice?
They could package the products individually. Buy the interface once,
then buy the software you need. When new models are introduced, buy just
the software again. At least it would be cheaper than the whole shebang!

I also love my FT-8000R. One thing I've noticed about it is its spectacular intermod rejection. I drive past a group of three paging towers (the three wise men) twice a day, and the 8000R never squawks, even with 155 MHz and 470 MHz public service frequencies scanning away. Reception in the 800+ MHz area is not quite as good as I'd like, but I don't really need to listen to my local PD from 10 miles away, anyway. Signal reports have been great, and a friend of mine went out and bought one after seeing and hearing mine. I'd highly recommend it, especially if you don't need the remotable faceplate and other enhancements that the 8100 has.

Good Luck and

Yup Larry,

Posts like this create more and more folks like me who were neutral on the code testing issue who now actively oppose continued code testing. In fact because of folks like you, MD, Vince and the rest I no longer operate CW at all, I want no association with such an bunch of egotistical bigots.

In the long run we will win, not because of Carl or Len or Butch or Ian but because of you and MD and others of your ilk. It is actually rather simple Larry; you treat people like crap and you annoy them, instead of converting them to your point of view you push them the other way. Actually I don't think this bothers you at all. I believe you don't really care about the issue at all but are simply a bully with dilusions of superiority because you can barely adequately perform a function that a machine could perform excelently. I suggest for your reading assignment "John Henry".

I have an ICOM W2A HT. It is a dual bander (2m and 440) with 60
memories. It also has dual displays.

It's receives 118-174
380-512
800-900 mhz

It has crossband repeat, it has been modified to transmit from 118-174
and 380-512 mhz. It includes a speaker mic, battery charger, antenna,
and the manual.

It is very good condition. I am asking $325.00

>It is my opinion that the Teamsters Union is the villian here. Lets
>try an get things turned around before UPS is forced to hire
>replacements and terminate employees.

Cry me a river. UPS workers who strike need to go back to school and relearn how the capitalist society works. Many of the part time workers are moaning about not being made into full time. Excuse me, but who's choice was it to go to work for UPS? If you don't like it, LEAVE, go get work somewhere else. Or have you ever thought that maybe the part timers are only paid PT because that's what they were hired for?

I really don't see why this is the government's problem either. UPS is not like the USPS, it is a private corporation. Government has no business interfering with private business matters like this. The rigth way is for companies like FedEX., Roadway, USPS to grab the business and capitalize on the UPS situation. That's the way it works in this country (or used to before we raised the red flag here).

I don't support the Teamsters (Hoffa and the MOB) either. The mob mentality prevents people from thinking and acting as individuals, and taking their own repsonsibility for their situation. Instead, it is much easier to join a mob, and release such responsibility to them (everyone is doing it, so it's okay).

Get real, either UPS will get back on track or they won't. If they don't someone else will come along and offer the service. The only way the government should get involved is maybe to expand the USPS operations in parcel handling.

3047. Diawa HF Meter For Sale

Newsgroup: rec.radio.amateur.equipment

For Sale

Daiwa CN-101L SWR & Power Meter
Nice cross meter needle reads both
SWR and power at the same time.
Has high/low and PEP/AVG switches.
Reads up to 1500 watts.
Covers from 1.8 to 150 so it can be used for
all HF bands and even 2 meters!
I purchased it new about 9 months ago and
it is in the same as new condition.

Price is $60.

Rich, N1VKO

The receiver is very poor for high speed cw under noisey band conditions due to the
ringing filters, distorted audio and poor dsp response. I took mine back. For those who are less demanding, They'll never know the difference.

I have the following radio equipment for sale. I have not listed any prices because this stuff is older and I have lost track of its value. Best offers will be considered and likely accepted.

I accumulated this stuff years back with the intention of putting a system together, but never got to it. Most items you could plug them in, tune them up, and they will probably work, unless noted otherwise.

For more information, or offers, please contact me by
e-mail. gerber@wdroc.wdc.com

Mostly two-way radio equipment, here is the list:

-- (1) EF Johnson Transcom II 571B VHF Mobile radio, 60 watt

-- (1) EF Johnson Transcom II test set, missing mic connector.

-- (3) EFJ Ultracom 508 VHF mobile radios, two need repair, cheap.

-- (1) box full of EFJ Discrete Call Gaurd PCBAs, P/N 023-6005-101.

-- (4) EFJ DTMF Microphones.

-- (4) Standard Microphones.

-- (1) Telephone Interconnect Model CI-1000 from Interconnect Technology Corp.

-- (2) GE Master Progress Line VHF Handheld Radios, (1) charger.

Send an e-mail if you are interested and would like more specific information.
I am located in Southern Minnesota.

Thanks...

> repeater the mobile set receives on one band only and TXs on the other
> band only.

For ONE way cross-band repeating, this is true.

Most radios allow TWO way cross-band repeating, where the 2m signal (for example) of the repeater's output is retransmitted by the mobile rig on 440 to the HT, and the 440 signal of the HT is retransmitted to the 2m input of the repeater.

Your *mobile* transmitter must be identified on each band that it operates on. In TWO way cross-banding, you *mobile* rig must identify on both 2m and 440 (in the example above). If you're using an HT on 440, and your mobile rig retransmits your ID on 2m, then you have successfully identified your HT (440) and your mobile transmitter *on 2m* (because your mobile rig is transmitting everything you send on 2m). Your *mobile* rig has *not* transmitted your identification on 440, and it never will, unless you switch over to 2m and give your ID there. Having someone else give your ID for you (on 2m) doesn't constitute a legal ID.

> :Each transmitter must identify itself.
>
> That is done when you identify on your HT. The HT is identified and
> the ident is relayed by your mobile set.

Not true in TWO-way cross-banding. *Your* signal is identified only on one band, not the other, and your mobile rig is transmitting a signal (yours, on one band, and someone elses' on the other) on TWO bands. Therefore, you must identify on BOTH bands.

> :The problem is, that your mobile (repeater) rig also retransmits incoming
> :2m signals on the 440 band. To remain legal, your mobile (repeater) rig

Not at all.

> If you understood cross band repeat you would see that it is only
> necessary to ident on your HT as normal.

Again, this is incorrect.

Dont forget, just because you wont bring up the other system
without the correct CTCSS tone does not mean your signal wont cause
interference if someone else is using the other system. It is still poor
practice to regularly use a system in this scenario.

3067. How I cured my RF feedback

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: algo@bellatlantic.net
Message-ID: <33e68063.2121521@news.bellatlantic.net>
Source record: 168690

Last week I added a new legal limit HF linear to the shack and suffered RF feedback on several, but not all, bands. The transceiver is a FT-1000MP and the linear is a QRO Technologies HF-2500DX.

The cause of the feedback was RF picked up on the interconnects between my Kam Plus and the Yaesu. I disconnected them and all problems went away. Will get some ferrite beads before I try to put the Kam Plus back into the system.

Just thought that I would share my experience. By the way, the QRO is terrific.

3070. Re: Dumbing down of Ham Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: 5doc@dxnet.com
Message-ID: <33e6a310.27925655@news.dxnet.com>
Source record: 168693

'Oh no you don't, Timmy!

Flying a plane and driving a car both risk lives! Your positions on testing of pilots for only some landing directions (as listed below) is just plane dumb. BTW, California now does some of it's "behind the wheel" license testing on real freeways!

My points remain firm. Hams are AMATURES, just like the license says... we are not broadcast engineers nor are we super RF lab technicians. Rigid ham radio tests given today are much too technical and demanding because the truth is in any given year most hams won't use even 5% of technical items we were tested on! So why test for crap that we don't need?

My position has nothing at all to do with lazy and has everything to do with testing for REAL usefull information, operational concepts and basic legal requirements for ham radio operators.

To further support my point, look at the radio license required for police, firemen, boat skippers, pilots and EMT crews. Most of these professions can and daily do use tranceivers for life and death situations. These folks can be licensed for using up to hundreds of watts of power, yet, there are NO questions of coax, transistors, nor are there any formulas or calculations required.

Now I will grant you, hams are granted and encouraged to experiment, improve and modify, all in the name of advancing the hobby. So why not ask questions like, "Which of these publications have information on H.F. Longwire Antennas?" Or, "You are notified that your transmitter is causing interference to another Repeater or Radio Net." "What must you do?" How about, "You are about to service a High Voltage Power Supply, what do you do first? What do you do next?" How about, "You are about to install a Antenna on your home, name three major dangers". "How is a 'calling frequency' used?" You get the idea.

Obtaining a ham license should never have to be more difficult than getting a drivers license. One can study a small booklet for a few hours the mourning and reasonably expect to pass that same afternoon. No weekend bash-class or calculator or need for even one formula!

If you like, issue a kit for amatures that include the a book of rules, regulations, legal requirements, safety issues and a ARRL Handbook. Each person testing must first purchase and own a kit before they are tested. Test that same day or a month later if you like.

I would also support two classes of ham radio licenses... a no-code license for operation above 28MHz and a slightly more advenced test for full privledges (except code) on all authorized H.F. frequencies and above. Code operation on any band should be a endorsement, much like radar on commercial licenses.

Those hams that would slam doors on citizens anxious to use frequencies that BELONG to them, are nothing more than another form of "good old boys"! It's these blue-nosed elitists who somehow beleive only THEY are entitled to radio spectrum that belongs to ALL citizens. They are of the same bastards who demand licenses for dancing in America!

These same 'good old boy' hams slowly bleed our hobby to death! You have heard of the concept of "use it or loose it"? One million active, licensed hams JUSTIFY the assignments of even more bands and frequencies. It's that simple.

Licensed hams are not your enemy, they are fellow Americans and we should never forget that these bands belong to ALL of us! The FCC only manages those bands for us. If we don't USE those bands, we don't NEED them and we have no reasonable right to expect to hold them for a hand-full of dah-dah-dah dah-dah's who need to get a real life. Got it Timmy?

3071. Re: FT 50 & VX-1...Best short antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: skoch1@aol.com
Message-ID: <19970805035701.XAA01180@ladder01.news.aol.com>
Source record: 168694

It has been posted on this newsgroup here before but it is certainly worth repeating. Many have found (myself included) that the stock antenna supplied with the Standard 508A works VERY well on both the FT 50 and the VX-1. I own all three radios and in testing and comparing I've found the Standard antenna outperforms the Yaesu standard issues hands down. One has only to hold the radio in one position, tune a station (a moderate to weak one), watch the meter with the Yaesu stock, then switch to the Standard...and....voila, improved reception. Transmit performance is also improved. The best part is that IT LOOKS GREAT. It is actually smaller than the stock issue for the VX-1.
As a side note, apparently Yaesu does not make their VX-1 antenna available as a separate order item (and incidentally, the VX-1 antenna IS better than the stock FT 50 antenna and because it is smaller, more desirable). BUT Standard seems to take a different view; you CAN order a 508A atenna from Standard for $ 25.00 plus shipping. I've got one for each radio, and I'm more than pleased with the results. Now, for even better performance (when it counts), I use the SMA 3 by Comet or the 270 by Icom (the latter has a BNC, but with the BNC-SMA adapter it works well and outperforms even the SMA 3). I carry both antennas with me to use when I need that extra 'umph.

.....Any questions?

Steve,
WB9WYM

That's nice John, but it's not for everybody. If CW is fun for you,
then by all means enjoy it. However, some of us would like the choice.

3073. Interesting FT-50 experience

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-05 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <5s68gi$q4s@camel3.mindspring.com>
Source record: 168696

Those who bought a Yaesu FT-50 when they first came out (as I did) will recall the "mod" whereby you pull the plug to interrupt a data file download and leave the radio in the "euro" mode. It happened accidentally back then to me when my computer froze during the download. Unable to get the radio back into the "USA" mode, I had to do the MARS/CAP mod to get the rest of 2 meters back on transmit.

It was my understanding from reading this group that a later firmware edition corrected the bug that allowed this to happen, and the new mod was the freeband mod.

I sold my old FT-50 a while back, but recently decided to buy a new one. (fickle, huh?) I just purchased a brand new FT-50RD today, August 4, and decided to program it using my old ADMS software. I made a new template file from the new radio, and then attempted to download my old data file using the new template file. I got a clone error, and guess what - I was back in the euro mode!! Just like the first one a couple of years ago. Again, I was unable to get back to the USA mode. I had not planned to mod this radio - but left with little choice, I unsoldered JP1 and everything works fine - although the radio is wide open on transmit and receive.

I just wonder if there is something about my version of the ADMS software that causes this problem. I am not upset in any way about it - just curious. Has anyone else had this experience?

regards, Don Davis (KE4KYO)

3074. Re: Opinion on TS-870S

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-06 00:00:00 UTC

Hi Steve!

I believe the TS-870 has no provision for upstream (RF freq) xtal or mech filters but depends totally on DSP at a very low IF freq. That seems a bad approach, and was commented on in the QST review of the radio (Feb 1996 issue)

Curiously, the TS-570 does allow adding a narrow CW xtal filter, which is a big improvement over not having one. In this sense the 570 is better than the 870, even tho it has fewer features.

When they have the technology to do DSP at true RF IF freqs, then is my replace mech/xtal filters: Not yet!

Phil

>
Cudos to the above. I'm a Ski Partolman and Divemaster drive a TR-7(at least until the fire I did) they are all fun. You snipped the part about Roll driving people away from a CW interest and that is the POINT of my original posting. Taking things out of context is not all that different than misquoting completely.

>I also operate code. BECAUSE I WANT TO. It's fun. It wastes a lot
>of my time that I could use with more efficient data-transmission
>methods.
>
No issue with operating CW if you enjoy it. I operate satellites QRP with hand held equipment because I enjoy it. Not as effective as my home station but it is fun, and I WANT TO.

Have you ever worked a satellite with an HT? Have you ever taught other to work satellites with an HT? Didn't think so. Am I superior because I do this regularly? I don't think so, it is just one of my interests.

>Most of us don't ask that you operate code because we like code,
>any more than I would ask you to engage in my leisure time sports
>because I like it. In fact, I prefer that you DON'T enjoy my
>sports (and Morse code) because it leaves more space in my
>little world.
>

Sorry it would seem I do enjoy your sports perhaps even more than you do and if the fates see fit I may even be of service to you some time. BTW I do operate CW mostly on VHF/UHF as I do a little rovering and when someone really needs that rare grid square I'm in I seem to be able to forget Roll the Troll and operate CW to make the contact. To this end I'm developing a portable RTTY station because I know

PACTOR/GTOR WILL get through when we can't copy the CW.

>
>Soon we won't have the ITU requirement for Morse code proficiency
>for amateur HF operation. A pity. I do hope we keep the code
>requirement as a part of incentive licensing in the U.S. as a
>requirement to legally use the CW subbands.
>
The incentive licensing plan may have been one of the worst ideas ever put forward in this hobby. It is what allows Roll and his kindred to feel some kind of synthetic superiority over those who pursue other interests than CW in this hobby. CW is a part of ham radio not all of ham radio. It's time to get the mode off welfare and let it find its natural nitch in the hobby. I think you are all afraid of is that if taken off the life support of mandatory testing it will NOT survive and you just don't want to admit it.

>You'll have your way. You'll win. Someday I hope you
>realize what that "victory" really means.

I hope it means the PhD RF type I work with who has never had an interest in HF because of code testing will bring his considerable skills to developing new techniques on HF as he has in the VHF/UHF bands.

>
>N6OTQ
>
>P.S. As your reading assignment I suggest viewing "Independence Day."

Seen it copied, some of the code, rolled on the floor laughing. The whole movie was pure camp. I give the venerable CW OPs the same creedence that I give the drunk crop duster flying an F-18(BTW I'm a high time pilot too) If you took that seriously you gotta get out more.

Your issue should not be with me because reading the newsgroups I lost interest in CW it should be with the folks who are creating resentment in people like me. But then I don't think you ever understood what I originally wrote you just picked out a snippet to take issue with.

Jerry

3093. Opinions on newer tranceivers?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-06 00:00:00 UTC
From: Harry Harbst <hharbst@ix.netcom.com>
Message-ID: <01bc9a1b$8967b180$bc3bd8ce@#hharbst>
Source record: 168566

Hi all,

My current setup here is an IC-706, due to space limitations. I have a strong desire however to put together a new station, since recently completing some renovation to my home wich will allow me the needed room for a shack. My problem lies with my inability to view, and operate for myself the newer rigs available. I am sincerely interested in any and all opinions on the listed models, and any specific pros and cons you may wish to offer.

Kenwood
TS-570s HF-6M
TS-790A UHF/VHF All Mode

Icom
IC-756 HF-6M
IC-821H VHF/UHF All Mode

Yaesu
FT-920 HF-6M
FT-736 VHF/UHF All Mode

Any help you'd like to give me is sincerely appreciated. I also don't want to limit myself to these radios. If you have ideas for other choices, please let me know. Some things of importance to me will be:

Ability of each of these rigs regarding CW receive
Capabilities for sattelite work. Not crucial, but I used to enjoy the occasional contact.
I'm lost on the whole DSP issue. Do you feel xtal filters as an option are important.
Overall transmit and receive capabilities. (Audio clarity...)

I'll leave it there for now. Feel free to e-mail me privately if you like, and thanks to all who read this post.

73,
Harry/KB8JXF
e-mail hharbst@ix.netcom.com

3094. IC756 or TS870S or TS450 for boat mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-06 00:00:00 UTC
From: "William G. Graves" <bgraves@ix.netcom.com>
Message-ID: <33E90A7B.6342@ix.netcom.com>
Source record: 168567

I have been going nuts trying to pick a radio for a long range cruising sailboat. I have narrowed the field by DIMENSIONS (can u believe this criteria?) to one of 3 radios that will fit. Actually some others would go but I want really great receiver and good CW features (straight key only). (straight key CW is for fun!)

The Kenwood 870 is a tight fit but I think I can do it. Its the most expensive of the three but the IF-DSP looks like its better than the IF-DSP on the IC-756. The 756 is also $300 cheaper than the 870 and has 50 MHz to boot! It seems like too good a deal - maybe the Kenwood has better circuitry?

The older TS450 is an easy drop in but doesn't have all the nifty DSP stuff.

Anyone comment on the 870 vs 756? Why is the 756 cheaper?
Haven't used DSP, but I have high/low slope tuning on my old TS940 rig.

N6RJD sends
tnx

Message-ID: <33E87FD8.48BC@apollo.wes.army.mil>
Source record: 168574

Greetings,

I have a Yaesu FT-ONE that will deliver 110 to 120 watts CW depending on band, however, in sideband it is only squeaking out 10-20 watts on a peak reading meter. Can someone advise me what I might do to fix this? I really hate shipping to CA for repair, its 50.00 round trip just for transportation.

3103. Re: Mars Mod for IC707???

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-06 00:00:00 UTC
From: k1rbs@aol.com
Message-ID: <19970806205601.QAA19987@ladder01.news.aol.com>
Source record: 168576

Hi Joe, George, K1RBS, send Icom a copy of your MARS or CAP license, and they will give you the mod, and it shouldn't void warranties, either. The FCC leans on the manufacturers to minimize the use of ham gear on CB, etc. I have had experience
with Icom, Kenwood, and Alinco, each was totally co-operative
after I identified my station with my assigned AFMARS calls. It is
best to get mods from them, not hearsay, because some unauthorized mods
have been destructive to the gear.

Sounds like the overvoltage crowbar is permanently fired...SCR ckt
and likely a spike from lightning shot shorted the SCR...look for
dead short across output with ohm meter with supply OFF and drained..
(and UNPLUGGED!)....then clip crowbar ckt (on PCB or in small black
plastic capsule at terminals)...then check for short again..
That should get it back up....BUT could be a XSTR is shorted and you
have 33 VOLTS at output now...UNHOOK all gear and see what voltage
is present after determining shorted condition...

Hmmm. Wonder how they come to that conclusion?

Is a mobile that is functioning as a cross band repeater under remote or
automatic control? When I put my mobile into cross band repeat mode it
is all automatic - I have no remote control capability over it. In this
case it is automatically retransmitting the signal of another amateur
station (mine... and whoever is on the other side of the cross band).
So by definition, when my station is cross banding for me, it's a
repeater, not a remote base.

Auxilary, repeater, remote... doesn't matter. There is no requirement
for "automatic" ID.

Sheeez. I admit to being pretty much just an appliance operator when it
comes to everyday ham radio... but how hard can it be to add your own
IDer to your system? Do the "manufacturers" have to do everything???
Something that just plugs into your mic connector when you need it? You
don't even have to build the IDer - you can buy them on small boards
from people like ComSpec. You can put an "ID-8" (isn't that CSI's
little IDer?) into a matchbox with a pigtail that jacks into the radio

when needed.

Can the NC-60B 15-hour charger (included with the Yaesu FT-50) safely charge a MAHA NiMH battery (without damaging the radio and/or battery)?

Thanks, John

3113. SMA Antennas for VX-1R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-06 00:00:00 UTC
From: mbgrant@ibm.net
Message-ID: <33e8dff1.91297937@news-s01.ny.us.ibm.net>
Source record: 168644
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.antenna

OK gang. I've heard a lot of talk about how the VX-1R stock antenna sucks pond water. (It's not too bad, but I have nothing to compare it with). I've also heard recommendations that the Antenna from the Standard 508 works well and is $25.

I've checked the AES catalog on-line, and have come up with the following SMA antennas by Comet and Diamond:

CMT SMA3 COMET 2M/440 9.75" SMA ANTENNA 39.95
CMT SMA501 COMET 2M/440/900 1.5" SMA ANT 29.95
CMT SMA503 COMET 2M/440 8.75" SMA ANTENNA 33.95

DIA SRH519 DIAMOND 2M/440 8.3"FLX SMA WHP 34.95
DIA SRH805 DIAMOND 2M/440/1.2 1.75"SMA AN 29.95
DIA SRH815 DIAMOND 2M/440/1.2 6" FLEX SMA 44.95

So my questions is:
How do the Comet and Diamond mini-whips (the 1.5" and 1.75") stackup?
Also, has anyone tried the SR815, it looks to be the best of the bunch, only 6" and covers 2-440 and 1.2, which will probably give good 800 Mhz coverage as well.

Thanks, as always, in advance.

Cross-posted to: rec.radio.amateur.misc,re.radio.amateur,rec.radio.amateur.equipment

You need a signal generator, distortion analyzer (or SINAD-der), a three port capacitive isolating coupler "T" , 20dB fixed attenuator, and 50 ohm load.

Install the capacitive coupler between the 50 Ohm load and Receiver Under Test (RUT) such that the 50 Ohm Load and the RUT are connected through the lossless branch of the "T". Next insert a modulated signal through the 20 dB attenuator to the capacitive branch of the "Iso T". Adjust the modulation to 60% of rated system deviation. Usually +/-3KHz for LMR FM. Adjust the signal generator to a high output to fully saturate the receiver. Apply the receiver output (deemphasized discriminator or speaker) to the distortion analyser and adjust for full scale (0dB) on the distortion analyzer with the filter disabled. Engage the filter, the distortion analyser and adjust the filter for a null , it should read a very low distortion and should be about -30db or greater down from 0. Now reduce the signal generator until the needle rises to -12dB. You have now calibrated the setup for 12dB SINAD.

Note the value of RF signal output from the RF generator in decibels.

Remove the 50 Ohm load and substitute an antenna placed in the normal vicinity of the noise source. Turn on the noise source and adjust the signal generator output (should need to be increased) until 12 dB SINAD is again attained.

Note the value of RF signal output from the RF generator in decibels.

Calculate the difference and therefore the increased signal in decibels required to attain 12dB SINAD in the presence of noise. That value is the desense. The receiver will need that very amount of additional signal to receive reliably when the noise source is present.

You will probably want to put the computer in various operating modes to determine the worst case scenario. This test will permit you to experiment with sheilding and antenna configurations that might improve the performance.

ISO-T hookup

This is actually a pretty handy procedure. But I've had a problem
trying to change the Home frequency on the V-HAM band away from
145.000. The manual description for this procedure seems to be missing
a paragraph. The notation of this home channel also show PRI indicating
that it is a priority or primary channel and I can't seem to find a way
to turn it off. I'd appreciate any thoughts.

Tnx Chris.

Did tests but need to figure which wires to clip to take out crowbar ckt:

1. Output with ohm meter with supply OFF and drained...Looks like short. Voltage across output terminals starts near zero, rises quickly (in 20 sec) to about 0.7v in abt 20 sec then continues to rise slowly.

2. then clip crowbar ckt (on PCB or in small black plastic capsule at terminals...Which wires to clip? Three small wires: Red from Output+ to PCB #1?; Black from Output- to PCB #2?; Purple from one side of SCR to PCB #3? Others?

Alan

For Sale: Ameritron ATR-15 antenna tuner

Features: * Handles full legal output
* SWR, forward power, reflected power meter
* Switches between three coaxial, one balanced,
and one random wire output
* Standard "T" configuration: C, L, C
* Switch positions for all 9 HF bands
* Manual included
* Two-core ferrite toroid balun for the balanced
output, configurable 1:1 or 4:1
* Backlit meter (with external 12V source)

Hint: Take a look at the most recent Ameritron (MFJ)
advertisement in QST.

Reason for selling: I finished my homebrew link-coupled tuner!

Price: $160

E-mail: al_lorona@hp.com.

3132. Dangerous Bill in Congress

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-07 00:00:00 UTC
From: "James F. Boehner, MD" <jboehner@scescape.net>
Message-ID: <33E9E3FF.28F6@scescape.net>
Source record: 168514
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner,rec.radio.scanner

To all radio enthusiasts:

I received the following on the SCAN-L list regarding a bill in congress that would seriously restrict the rights of radio hobbyists, Amateur Radio and Scannists alike.

Action is needed NOW to contact your local representatives. There is an effort to amend the Communications Act of 1934. If passed, it would be illegal to monitor any of the land mobile transmissions. This would effectively prohibit extended receive on VHF/UHF Amateur Radio rigs and perhaps eliminate scanners completely.

This is a serious threat to the rights of radio hobbists. Please read the following below, and TAKE ACTION! Call, or FAX your representatives IMMEDIATELY!

'73 de JIM N2ZZ

Please give this information the widest possible dissemination on all hobby
forums. The author of this message grants permission to repost or reprint
the information below unconditionally.

Here is the latest legislative threat to the monitoring hobby. Folks this
bill is pure poison to all branches of the radio hobby. In particular. I'm
extremely concerned with section 3 of this bill amending the Communications
Act of 1934. Every radio listener and ham needs to contact their elected officials in Washington and voice opposition to this bill.

Unlike the Markey bill, HR 2369 does have cosponsors and given the timing in
the legislative calendar, I feel it does have an excellent chance of getting
through Congress this session. This bill has the same provisions in it as
the Markey bill (HR 1964) plus the new language on scanner mods in section 1
and the new very restrictive language for the Comm Act of 34 in section 3.
This effects every radio listener from shortwave right on up to the microwave regions. If your hobby is listening to something other than

broadcast radio or television, ham or CB this bill could and probably
will
effect you.

Bottom line:
I will be posting additional info and analysis after we talk to the
legal
folks. On the surface, this doesn't look good at all. We are going to
have a
major fight on our hands here.

Best Regards,

Larry Van Horn

<<<<Here is the bill -- snip>>>>

HR 2369 IH
105th CONGRESS
1st Session
To amend the Communications Act of 1934 to strengthen and
clarify
prohibitions on electronic eavesdropping, and for other
purposes.
IN THE HOUSE OF REPRESENTATIVES
July 31, 1997
Mr. TAUZIN (for himself, Mr. MARKEY, Mr. OXLEY, Mr.
GILLMOR, Ms.ESHOO, and Ms. MCCARTHY of Missouri) introduced
the
following bill; which was referred to the Committee on Commerce
A BILL
To amend the Communications Act of 1934 to strengthen and
clarify
prohibitions on electronic eavesdropping, and for other
purposes.
[Italic->] Be it enacted by the Senate and House of
Representatives of the United States of America in Congress
assembled, [<-Italic]
SECTION 1. SHORT TITLE.
This Act may be cited as the `Wireless Privacy Enhancement
Act of
1997'.
SEC. 2. COMMERCE IN ELECTRONIC EAVESDROPPING
DEVICES.
(a) PROHIBITION ON MODIFICATION- Section 302(b) of the
Communications Act of 1934 (47 U.S.C. 302(b)) is amended by
inserting before the period at the end thereof the following:
`, or

to modify any such device, equipment, or system in any manner
that
causes such device, equipment, or system to fail to comply
with
such regulations'.
(b) PROHIBITION ON COMMERCE IN SCANNING RECEIVERS-
Section 302(d) of such Act (47 U.S.C. 302(d)) is amended to
read
as follows:
`(d) The Commission shall prescribe regulations denying
equipment
authorization (under part 15 of title 47, Code of Federal
Regulations, or any other part of that title) for any scanning
receiver that is capable of--
`(1) receiving transmissions in the frequencies
allocated to
any commercial mobile service (as defined in section
332(d),
`(2) readily being altered to receive transmissions in
such
frequencies,
`(3) being equipped with decoders that convert digital
commercial mobile service transmissions to analog voice
audio, or
`(4) being equipped with devices that otherwise decode
encrypted radio transmissions for the purposes of
unauthorized
interception.'.
(c) IMPLEMENTING REGULATIONS- Within 90 days after the date
of
enactment of this Act, the Federal Communications Commission
shall
prescribe amendments to its regulations for the purposes of
implementing the amendments made by this section. In
prescribing
such amendments, and in response to subsequent changes in
technology or behavior, the Commission shall review and revise
its
definition of the term `capable of readily being altered' as
necessary to prevent commerce in devices that may be used
unlawfully to intercept or divulge radio communication.
SEC. 3. UNAUTHORIZED INTERCEPTION OR PUBLICATION OF
COMMUNICATIONS.
(a) AMENDMENTS- Section 705 of the Communications Act of
1934
(47 U.S.C. 605) is amended--
(1) in the heading of such section, by inserting
`interception or' after `unauthorized';
(2) in the second sentence of subsection (a), by
striking

`and divulge' and inserting `or divulge';
(3) in subsection (e)(1)--
(A) by striking `fined not more than $2,000 or'; and
(B) by inserting `or fined under title 18, United
States
Code,' after `6 months,'; and
(4) in subsection (e)(3), by striking `any violation'
and
inserting `any receipt, interception, divulgence,
publication,
or utilization of any communication in violation'; and
(5) in subsection (e)(4), by striking `any other
activity
prohibited by subsection (a)' and inserting `any receipt,
interception, divulgence, publication, or utilization of
any
communication in violation of subsection (a)'.
(b) RESPONSIBILITY FOR ENFORCEMENT- Notwithstanding any
other
investigative or enforcement activities of any other Federal
agency, the Federal Communications Commission shall
investigate
alleged violations of section 705 of the Communications Act of
1934
(47 U.S.C. 605) and may proceed to initiate action under
section
503 of such Act (47 U.S.C. 503) to impose forfeiture penalties
with
respect to such violation upon conclusion of the Commission's
investigation.

3133. Power Amp Advice: Maha, Mirage or rfConcepts

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-07 00:00:00 UTC
From: jcwren@atlanta.com
Message-ID: <33f034b7.781717350@nntp.atlanta.com>
Source record: 168515

I'm thinking of buying a dual band (2m/440) power amplifier
for emergency use. I have little to no experience with these, so I'm
turning to the net for opinions.

Maha seems to be a pretty good company. I'm pleased with
thier customer support on the NIMH batteries and chargers.

I've heard that Mirage used to be kind of cheesy, buy about a
year or so ago really turned their act around.

I've got a Kantronics KAM+, but other than it's a pretty
decent TNC, doesn't tell me about their amps. Their amp does have the
lowest output on 440 than the other two.

A friend of mine says that a year ago, it'd be no contest,
he'd buy a rfConcepts, but nowadays, it would be a lot harder
decision. His rfConcepts does seem to be a more solid amp,
construction wise, but the Mirage we're comparing it to is kind of
old.

The models in question are the Maha MH-A201, the Mirage BD-35,
and the rfConcepts 2/70G.

Any opinions good or bad, experiences good or bad that you'd
like to share?

Andre, these parts were made by Mitsubishi, if you didn't already
know.

It may be possible for you to repair your faulty part.

If you carefully saw off the top surface of the plastic cover with a
very fine-toothed saw from a model-maker's shop, you will see that the
circuitry is made of metal tracks and thick-film resistors fused onto
the surface of ceramic substrate. The two RF transistors are mounted
onto the metal heatsink piece, in holes in the main ceramic substrate.
Depending on the unit, there may be a Beryllium Oxide insulator under
the transistor dice. This substance is very dangerous if broken, read up
on the risks of Beryllium Oxide, BeO.

Often, the main substrate has been cracked by too much heat during a
long ragchew, or due to a big file/picture being sent. With a
low-magnification microscope, or with a jeweller's loupe, you should be
able to see the crack, and where the metal tracks (also used to make
printed inductors for the matching networks) have broken. With a small
but powerful soldering iron, and tweezers, I've been able to re-connect
the broken tracks, even in the printed inductors. On one occasion, I
came across a unit where the crack had destroyed the bias diode of one
of the transistors. I
soldered in an ordinary wire-ended diode after removing the remains of
the broken diode. I used a little thermally conductive paste to make the
new diode sense the substrate temperature.

I've repaired several of these modules. I tried on the first one on
the principle that there was nothing to lose, and was successful! Since
then, I've bought a good stereo microscope and a proper surface-mount
soldering iron, but not had any TX output modules that needed fixing :-)

PS, on the Kenwood/Trio 7800 there is a power transistor in one of
the DC feeds to the output module. I've replaced a few of these. If one
fails, it looks like the RF module is dead, but only a cheap DC switch
transistor is needed.

I hope this helps a little..

Cheers
David GM4ZNX

The only mod I did to mine was to keep the 12VDC line active even when
in the SSB mode. This allows you to use microphones that employ
powered electret-condenser elements (most of them).

> Thanks and 73,
> Thom KI2N
> Fort Lee, NJ

I think the 706 is a better investment. Its going to have a higher
resale value when you offload and there is a long list as to why...

More Users - More Software!! (Hey, don't you use a PC for the same reason?)
More Users - More Mods!! (Hey, don't you use a PC for the same reason?)
More Users - More cures for bugs! (Hey, don't you use a PC for the same reason?)
More Bands (160 - 2) + extended receive
More Functions (Spectrum Scan, Built-in keyer, Computer and Tuner I/O, etc.)
More Performance (Very hot receiver, 1 Hz resolution, 100 alpha memories, etc.)
Best Display (Large back-lit LCD) for easy views in your truck

The Alinco is cute package but its sales fell through the floor
when the 706 came out. The guys with the latest designs almost always
win.

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with > 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

http://www.mv.com/ipusers/wd1v/Page2.html

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

A trip to my home page also reveals there are many superb files and programs for amateur radio operators that want to use Mac computers. See more details in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Email Reflector - send an Email to all Macnet users on the Internet.

* Macnet Roster - a virtual "Who's Who" HyperCard stack with > 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and

their passions and put a design on your Mac Radio future. See what neat things are being done with Macs and Ham Radio!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get your new programs with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lots of links to great Mac FTP sites for radio, electronic engineering, and similar data.

Hi,

I am considering purchasing a WinRadio.
This is a board that plugs into a PC and converts
the PC into a seemingly very nice scanner.

I am looking for comments from anyone who
has experience with this unit, both pro & con.

My specific interests are in the area of broadcast
DX and public Service band scanning.

Thanks in advance.

Message-ID: <5sdi0d$nn3$1@bashir.ici.net>
Source record: 168594

Icom IC 3220 H dual band mobile

2M is perfect, 440 rcv is perfect

440 transmit, since the antenna tipped

over, works only in cold weather.

Had this (? identical ?) problem before

and it cost me under $80 for Icom to

fix and ship. If you are careful with

antennas, then you should have no

problem. Due to Bristol County's

divorce court, I must sell this quickly.

Cost me over $600.

$190.

All shipping to be paid by buyer.

Please contact Bill Howell, N1IPQ,

whowell@ici.net or 508 339 7872

or POB 2041, Norton MA 02766

I take it you don't like their crowbar, if they use an SCR, just clip the thing out. I personally don't like crowbar's either and some locals have had trouble with astron's units when used with battery backed up kenwoods.... I would rather use a healthy transient supressor.

3171. Compare IC 756, FT920 and TS870

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: rlindzen@mit.edu
Message-ID: <33ed78d7.4314828@news.mit.edu>
Source record: 168458

Does anyone know where I can find a comparison among the IC756, FT920 and TS870? Any comments would be welcome. I'm currently using an IC751. I have no real complaints, but I have the itch for something newer.

Tnx, Dick KA1SA

>

I tend to agree. When the curvature of the earth is neglected but both
transmit and recieve antennas are fairly close to the ground, the signal
strength falls off as 1/ R^4 and remarkably is independant of frequency
for VHF and UHF frequencies. This is in considerable contrast to free space
where the signal strength falls off as 1/R^2. Given the 1/R^4 law, a 15
dB increase in effective radiated power (ERP) will cause an increase in
range, all else being equal of 10^(1.5/4) or 2.4 times.

hi- i am looking for any comments opinions on this radio.
I got one reply saying they had problems with rf getting into the remote cable.
anyone have any other opinions, also if you are able to answer the following questions-

-can you set a non standard repeater shift (like 4.6MHz or 3MHz)
-Is the audio loud enough in a car
-how sensitive is the out of band reception/

thanks
Sean

3175. Yaesu FT990 - Low Power Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: Paul O'Kane EI5DI <okanep@iol.ie>
Message-ID: <33EBF3EF.18D@iol.ie>
Source record: 168462

I've an FT990 that used to give 100w out on all modes.
Now it's giving only 11 or 12 watts - exactly the same power
used when the antenna tuner is matching.

Any suggestions on what I should check?

Thanks & 73,
Paul EI5DI

>

This is a big mix-up!

The company you said went broke was CommFocus
with a product called Softwave. That was a couple of years ago.
I am one of those people who wanted to buy one, but I was lucky
for not having lost any money (I refused to put a deposit).

But the company who makes Winradio is alive and well and there is no
relationship between the two.

Also, the product is very different. Softwave was just a shortwave
receiver . Winradio is a wide-band scaner to 1300 MHz.

You can see Winradio on http://www.winradio.com and download
their software.

Incidentally, I own a Winradio and I am very happy with it.

Cheers,
John Carol

3187. FS: Tower climbing belts

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: Climbing belts <k1cc@mindspring.com>
Message-ID: <33EBB43D.D3CBDFCA@mindspring.com>
Source record: 168474
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna

I have the following safety belts for sale, all are unused and made by Miller Equipment, a top-quality supplier of OSHA fall protection equipment.
Quantities are limited, so it's first-come first-serve. Add $7 per order for shipping via Fedex or USPS Insured.

Miller publishes the following size table:

Small: 32 to 40 belt size
Medium: 36 to 44 belt size
Large: 40 to 48 belt size
Ex. Large: 44 to 52 belt size

For example, I have a 38" waist and I can fit into a small belt (on the last hole!), but be sure to make allowance for extra clothing.

1) Body belt with saddle, (2) "D" rings on both the waist belt and the seat belt. This is the ultimate in tower climbing belts, allows you to use the secondary belt as a saddle when you're in place to save your legs. $50 (Small, Large, no Medium)

2) Body belt with saddle, (2) "D" rings on just the waist belt. This is similar to the above, except that only the waist belt has
"D" rings, but still allows you to transfer some weight to your rear end to save your legs. $45 (Small, XL, no Medium or Large)

3) Body belt with (2) "D" rings (Small only). SOLD OUT

4) Tree trimmer belt, (2) "D" rings on the saddle but not on the belt, 3" back pad. (Small, Large, no Medium). $50

5) Body belt with single "D" ring, twist-lock snap hook attached to "D" ring allows a lot of flexibility in motion (such as in construction work). removable 3" back pad. $20 (S, M, L)

6) Body belt, no "D" rings. Use with a lanyard (see below) for bucket work, ladder climbing, roofing work, etc. $10 (S, M, L, XL)

7) Single-snap webbing lanyards, use with the body belt above. Snap on one end, loop on the other end. 8000 lb tensile strength,
great as an extra safety strap for tower climbing, lift or securing
heavy items, pulling your truck out of the mud, etc. $10

for
single-snap, $15 for single-snap with shock absorber.

8) Body belt (made by Rose, model #502522), two straps attached to waist belt with snap hooks on each end (one size fits all). $15.

9) Shoulder harness, adjustable shoulder straps, double ply waist strap, single "D" ring on back. $30 (Large only)

10) Full body harness, (2) shoulder "D" rings and (1) back "D" ring. (Small only). $45

11) Full body harness with (2) shoulder "D" rings (Small only). $45

12) Full body harness with (1) back "D" ring. (S, M, L). $45

13) Tool pouch with loops to attach to any belt. $7

73 and safe climbing!

I had a similar problem with my MFJ-259. The battery holder broke for no apparent reason. Out came the J-B Weld and some electrical tape and I was up and running. So what happened to the so called "no questions asked guarantee" I would rather fix it myself than go thru the hassle of dealing with a manufacture. :-) The 259 is a great piece of equipment and I can't imagine doing without it now, so I'll put up with a few short comings! Good luck.

3197. Need advice re: portable receiver (shortwave)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: billajohnson@hotmail.com
Message-ID: <billajohnson-0808971849180001@lts3-084.snlo.dialup.fix.net>
Source record: 168484

I need advice on the best (but not expensive) portable receiver.
Also, is there a good business with a great reputation that
sells used portable receivers. I don't have a lot of money
but would like to buy a great portable shortwave receiver.
The only one I have seen for sale is a Sangean ATS-909 but
it is very expensive ($249.95). Please respond in this newsgroup
since I rarely check my e-mail due to spams.
Thanks in advance.

For Sale or Trade for Collins Equipment:

SGC SG-2000 Commerical Grade HF Transceiver A rugged HF transceiver with 150W PEP output. Modes: USB, LSB, CW, true AM in receive mode and Data.

In Excellent condition (Looks new) with all manuals, microphone, and remote-head kit already installed. (20' cable and swivel mount bracket...great for mobile use in car, truck, boat, airplane, or even a bicycle!

Asking $1050.00 plus shipping or would consider trade for/towards Collins 75S3/3B/4 receiver in CCA excellent condition - Round Emblem.

Send email or call me at 408-257-5383.

Okay...here's the poop:

This is a beautiful modern digital radio capable of transmitting on ANY frequency from 1.8-30MHz. Can also be used on Marine and Aviation frequencies and is built like a tank. See it at SGC's web site at:

http:/www.sgcworld.com/

Comes programmed with 644 ITU channels and 100 user defined channels that can be set to Ham frequencies in the 1.8 - 30 MHz range; receives 500kHz-30MHz. All push-button controls!

Keypad control with 21 illuminated keys. Scans ITU channels and 100 memories with adjustable scan speeds and rates. LARGE, LCD, wide-angle display, adjustable back lighting for easy viewing night or day. Operates with the front panel removed to function as a remote control head (20 foot cable included) or can be used as a single unit. Will accept up to 8 remote control heads. Built-in computer control capability, can be controlled by any standard RS-232 protocol on all Digital modes.

12VDC @ 16A - 4 3/4"h x 10"w x 15"d - 12 lbs.

See the SGC web site for more info and available accessories.

Thanks for the reading.

Source record: 168488

In <33ebfa59.10118722@nntp.groupz.net> kb4gyt@groupz.net (Paul) writes:

>THANKS FOR READING MY MESSAGE.I AM INTERESTED IN COMMENTS FROM OWNERS
>OF TEN-TECS (ESPECIALLY THE DELTA)."CQ"MAGAZINE GAVE THE DELTA A
>PRETTY GOOD REVIEW BUT "QST" GAVE A LESS GLOWING REVIEW.I AM MOSTLY

Well, CQ reviews, in my opinion, are just verbatim transcriptions of
the advertising material. I have not seen any real independent
ideas on the rig come through any CQ review. I don't read them
anymore. I don't quite find QST reviews independent, but those
guys have a way of saying things nicely so as not to offend their
advertisers, but yet let you know that the rig has some problems.
I appreciate that a lot. I would trust the QST review as far as
it is dated before the rig you pick up. I would call the Ten Tec
guys and ask them about the review, they will be fairly straight.
I know that the Delta has a few idiosynchrasies, but once you get
used to operating the Jones filter correctly, it works fine. There
are a few Deltas that have real problems, you really need
to operate the one you are interested in, that is my advice on
ANY rig you want to buy anyway.

>SEVERAL OLDER TEN-TECS AND FOUND THEM TO BE GREAT FOR CW (AND SSB) BUT
>LACKING THE ABILITY TO OPERATED "SPLIT" WHICH MAKES THEM USELESS FOR
>SERIOUS DXING.THANK YOU FOR YOUR TIME AND COMMENTS.

I don't quite understand this comment. In 1978, when the Triton IV
came out, there was an optional external VFO allowing split operation
AND DUAL RECEIVE (in band). No one else had that as far as I recall,
and it was not expensive. Today the ads are full of this "dual receive"
stuff like it is a new feature invented for the modern a-go-go DX'er.
It has been here for a while.

So, any of the old Ten Tecs will do what you want, all you need to do
is find the external VFO to go with it. They are not plentiful, but
are to be found relatively inexpensively. I have had a few, even for
my Corsair II.

Good luck.

Hi!

I have a FT-50R and want to use the ADMS-1C software with my Mac Performa 476. (68040 25Mhz CPU, 36MB Ram).

Do I need some version of Softwindows? Which is the least expensive version of Softwindows (there's so many different ones!) that will run on my non-power Mac.

I have to know for sure before I buy the software.

Thanks,

> email: rsellers@rockford.com

Roger, to the best of my knowledge the only people making any
equipment that will operate in our 900 band that is marketed to amateurs
is Hamtronics (yuck). You may want to try modifying an old commercial
rig such as a GE exec II 800 conventional or a Regency Microcomm series
unit, I think an old GE Marc V trunking repeater would make a dandy 900
repeater with some helical trimming and cap changes on the exciter. The
PA will work as is. The GE TMX 9315 will work with an eprom change, but
these are hard to come by around here.
Good luck and 73
Chris N9LLO

3211. Re: IC756 or TS870S or TS450 for boat mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: nitz@clark.net
Message-ID: <5se35g$pi6@clarknet.clark.net>
Source record: 168534

Bill:

I have had an 870 for about 1.7 years and I love it. It is an excellent CW rig (nice K1-Logikeyer built in) for the 'advanced intermediate' CW operator, which probably stretches my ability. There have been some issues about strong signal interference on crowded bands removing the desired signal in the pass-band, but I don't run sophisticated antennas here, so turning on the Attenuator has eliminated this problem for me.

The digital filtering is excellent, and the 50hz band-pass actually works without ringing. The SPAC filter (speech processing auto-correlation - not sure why it is named that) works GREAT for separating noise from CW signals, in some cases there's a night and day difference in copyability. This filter works best when the signal is noteably above the noise...it doesn't do to well with the signal and noise are about equal.

The 870 makes a great short wave listenting receiver, if you like that. Nice sounding A.M. broadcasts when you open up the filters. It is also a great SSB transmitter, with good high fidelity audio.

The radio is perfect for me...I'm a cross section of a rag chewer, contester and CW operator, who likes playing with the computer interface. I'm not a big time operator, and rarely devote more than several hours per week at most to the radio. Another radio you might look at if it'll fit is the new Yaesu ft-920.

I suspect a ft-1000MP is out of the question for your boat.

Well good luck...it's an agonizing but delightful problem to have, isn't it?

Hope we get to chat on the air while you're on that trip, Bill.

73 and good sailing,

Jim Nitzberg [WX3B]

>function, pleeeeze shed some light on this for me... I have had a few
>other people ask me about this, and Icom hasn't replied.

Did you ask ICOM ? If so how was that done. ICOM does not monitor
these newsgroups.

The W32A has a pocket beep function. Place the radios into tone
squelch on the display it will look like this: TSQL((*))

Now every time someone comes on frequency transmitting the tone you
choose, the radio will go into a beeping cyclefor about 30 seconds
thus alerting or paging you that some one of interest is on
frequency..

The W32A does not have the DTMF paging capability the W31A had.

3218. MFJ-259 SWR Analyzer woes

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-08 00:00:00 UTC
From: Ed Cregger <ecregger@jaguarsystems.com>
Message-ID: <33EB16BF.FAD708E@jaguarsystems.com>
Source record: 168541

I've used MFJ products for over two decades now. Admittedly, some of the equipment is not exactly top of the line, while the remainder is at least usable. I'm not rich, so, many times, it's either MFJ, or it's nothing at all. I've learned to accept certain shortcomings over the years, through necessity. However, this latest failure in quality control has me a bit ticked.

One month after I bought my analyzer, a friend came by the house in his truck. He was having trouble getting an antenna to tune on his mobile ten meter setup. Out comes the analyzer, which had been working just dandy, and out to the driveway we go. After disconnecting the antenna from the rig and connecting it to the MFJ-259, I push the power button. Uh-oh! No power-up! It can't be the batteries, they were almost new. Further investigation revealed two battery holder failures. Quickly I made up a cable and operated the Analyzer from the trucks electrical system. I call MFJ, they want me to fax a copy of the receipt. No can do, would take too long, so I pay for the new battery holders with the credit card.

Oh, joy! The battery holders arrive, are installed and I'm back to be a satisfied customer. Right? Wrong! The next time I went to use the Analyzer, the same problem reappeared. The two new battery holders had failed. But now there was a new problem as well. The tiny rivets which held the metal clamps that hold the battery holders were coming loose!

I had the pleasure of meeting Mr. Martin F. Jue some years ago at the now defunct Delaware Amateur Supply's open house in New Castle, DE. He is a very amiable and knowledgable individual and a pleasure to talk with. Quite a unique personality, to say the least. I have just one thing say to Mr. Jue:

MARTIN! WHAT WERE YOU THINKING!

I can understand how an inferior part can end up in a product from time to time. But to send me the same failure-prone junk for a replacement part - I don't know. It's a bit disgusting, to say the least. I'm about to lose faith in MFJ. My dollars are about to seek another source of affordable, yet usable equipment. What say you?

Ed Cregger

I have two exc condition Collins 75S-3Cs. Both are collector quality, one is a RE and the other a WE. No dents, scratches or blemishes, and both have recently been professionally checked and aligned. My current situation does not allow me to keep all this Collins gear, so I'm offering these beautiful S-Line receivers for sale. I will entertain cash or trade offers on either one or both.. I had listed these receivers several months ago, and then decided not to sell them due to the fact that I didn't think I could ever acquire better S-Line recvrs in the future. Now, I must sell them even though I would prefer to keep them. So, make me a sincere offer, cash or trade, and you can wind-up owning
one of these extraordinary receivers. If you are looking for quality and condition in a "top of the line" S-Line receiver, I have it both in RE and WE. Joe, K4JJ

rec.radio.amateur.equipment

Are you tired of that long url, which users have to type in just to get to your site? Well, we now have web site redirectors, to shorten that process.

These are currently only available for licensed amateur radio operators, and cost just $5.00 per month. Your web url will appear as kb8uyz.com/yourdirectory, where yourdirectory is the name you choose, such as your callsign.

The redirectors are intended for use with Netscape 2.0 or Internet Explorer 3.0 or higher, but a text hyperlink is available for those users not yet using these browsers.

For more information, reply to this email message, or see our web site at http://kb8uyz.com/redirectors.htm.

For good filters, I would stick with the Omni a,b,c etc. series or the Corsair1 or 2.
This way you can add the xtal filter you need for cw. The Jones filter may be ok but I've never tried one. I doubt if it is as sharp as the xtal filter. If you can afford $1,200, get an Omni 5. It's the best receiver for cw.

True I.F is like the Collins dsp receiver uses. It has no RF
components from the RF amplifier all the way to the speaker. It's all
DSP. It requires a PC to run it and cost
is about $15,000.

BTW, The TS-870's dsp does technically qualify it as an I.F dsp since
after all, 11kc is
intermediate between the last IF and the audio stage. Sorry. I just
don't like listening
to remanufactured audio.

Hi, just thought I'd save you a bit of time. I already tried using my ADMS-1C(ver 1.04) with my VX-1. No go. I get about a 4% file transfer,then an error message. I think there is some type of ID code in the header portion of the file. I even tried leaving the data cable unpluged for a secnd or two when starting the tranfer. And also tried both files with the USA templates and others the the "EURO" template. Just hope that the ADMS-1D doe bot screw up the VX's ability to program Cell band freqs. But maybe there will be some "good" patches in there to cure some of the radio's other (sw)ills. 73 DE WA1YKL

Hi Jeff, here's the other side of the coin. I've been a ham for 45 years, climbed almost every kind of support there is and have never used a safety device of any kind. I ride motorcycles and bicycles without a helmet. I SCUBA dive without a buddy. I never wear a seat belt. Please tell me the day that I'm going to die and I'll do something special on that day. Otherwise, it ain't worth the effort. How come I'm not dead? All this OSHA BS is taking the fun out of life. I don't understand people who risk their life bungie-jumping and wear a helmet. Wouldn't it be more of a risk and therefore, more fun, without a helmet?

3235. RF Squelch - Nice feature on Standard C510

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-09 00:00:00 UTC
From: dddavis@atl.mindspring.com
Message-ID: <5sgjmr$d6b@camel1.mindspring.com>
Source record: 168359

I visit Georgia Tech campus in downtown Atlanta once a week, and the RF environment is terrible there. There are paging transmitters there which just tear up UHF. Even with the quelch turned all the way up, most HT's with wide receive are useless there. The Yaesu-FT-41R was pretty good with the squelch all the way up, but even then the pagers would break through occasionally. I took my Standard C510A to campus the other day, and decided to see how the RF squelch feature works. I had not used this in the past, and the default condition is OFF. In short, it works great! I just turned up the RF squelch a couple of notches, left the "regular" squelch at its default setting of 2, and NO pagers broke through at all. I was right on top of the repeater I wanted, so there was no problem hearing it of course. I guess this might not work so well if you were on the fringe, but that is not ususally where I have RF noise problems.

If you need an HT which works well in the presence of RF noise, check this one out. RF squelch is a nice feature that I had never tried before now. Wish all my radios had it.

regards, Don (KE4KYO)

Commercial climbers do not have to observe the various OSHA requirements
either, as long as they are sole proprieters and not employees. OSHA
only regulates the safety relationship between employers and employees.

I doubt we will see a glut of belts on the market, because climbers will
still use them for positioning (i.e., clipping on to the tower and
leaning out to work), and for hanging their bolt bags and spud wrenches
on.

Fall protection is really a separate issue from positioning yourself to
work (and should be), and, as you say, is an excellent idea.

There is a big difference between risking your own butt and making an employee risk his. OSHA only regulates safety issues between employers and employees.

I don't imagine you have ever had to pick up the pieces of a dismembered climber that didn't think he needed to clipped in and put them in garbage bags for the medical examiners office to pick up; or wash his brain matter off the tower; or stumble across bits of his skull months after the "accident". I have and it is the most disquieting thing that ever happened to me. It gave me nightmares for a month. And I didn't even know the guy.

Ask your wife/girl friend/son/daughter/best buddy how they would feel after they found you at the bottom of your tower/under your motorcycle/ejected from your automobile with the parts of you that are supposed to be inside splattered around the outside. You would be the lucky one, you'd be dead. They will have to deal with the images in their brains the rest of their lives. Thousands of GI's came back from viet nam/WWII/WWI profoundly disturbed men because they had to witness the effects of violent trauma on the human body/psyche.

According to the service manual I've just purchased with my new FT-8000R
there have been no revisions since it was published (c.f. the FT8500
which has between 4-6 depending on which board you're looking at).

Therefore I would think that mods should be consistent. Can't tell you
how to change the minimum step size, though.

3246. DSP Noise cancelling equipment, what works?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-09 00:00:00 UTC
From: Jay <jay123a@ptw.com>
Message-ID: <33ED0D55.6A17@ptw.com>
Source record: 168370

Hello All: I have a Yeasu 757GTXII in my mobile, and have a pretty good noise level from the local araea in the Mojave Desert. I have two types of noise, one a little ingition noise, and local ambient noise, this local type is noise is in the air, and is its level changes in different locations. This ambient noise is noticed with the engine off, and far away from power lines. These noises are herd fron 20 meters to 10 meters. My antenna craps out after that bandwidth.

What Digital Signal Processor (DSP) product works for eliminating these two type of noises, I would be happy with a reduction of noise in the order of 10 to 20 dB increase in signal to noise ratio.

Any and all inputs and suggestions, please!

Jay at jay123a@ptw.com

All 5 people I know who have this unit have suffered this same problem at one time or another. Guess I accepted this and bought 10 extra battery holders from either American Science and Surplus or Goldmine Electronics. Thought they would be just as bad but they seem to be al little better. The entire holder seems to be under stress as though it's too small. My originals haven't gone yet but they look close to it. And yes, the clips are nicely swivelling around like they're about to go too. Couple of short screws and nuts should fix this or maybe some strategically placed velcro. Wonderful stuff that MFJ. I'm looking over at my model 108b dual LCD clock. The left clock says 9:47 and the right one says 2:53. The right time is somewhere in between. I synchronized them about a week ago. On my refrig is a 99 cent stickum up clock from Walgreens. It's 1 minute off after 60 days. I do have 3 different MFJ tuners and love them all.

Slide the battery 1/2 way off the radio, now while pressing and
holding the function button, slide the battery back on the radio.
Then press power and the radio should start.

The above is described in your operators manual on one of the first
few pages. It is a CPU starting function.

From: windbrkr@fred.net
Message-ID: <MPG.e5633b77b515fc99896c9@news.fred.net>
Source record: 168414

And here's another question: I've got an Astron VS-35M that I use to power my HF transceiver. It's got controls and meters for both voltage and current. I have the current control set at "Max", but have the voltage control adjusted at 13.5V to 14V on the meter.

Should I just go ahead and set the voltage control to "Max" as well? That would nominally put 15V at the output terminals.

My guess is that it may be better to have a bit more voltage potential, though I haven't noticed any voltage drop when transmitting as things are presently set up, at least not on the front panel meter.

I have heard that trying to operate at lower voltage, say, less than 12V, can be bad news for a transceiver.

Any comments? Thanks.

Well, not in my experience, Steve.

Creates two separate directories with two EXE files (ADMS-1C, I mean)
andnother config type file in each.

In any case, cable for FT-51 will not work with FT-50 without an
adapter. But the FT-50 cable should work with the VX-1R.

If your theory is right, ADMS-1C will work with the VX-1R. Since I have
one, I'll test out your approach when I get time (not today -- VE duties
will such up my spare time).

Message-ID: <33EC7FE7.2A6F@ix.netcom.com>
Source record: 168419

If you can add mech or xtal filters to the 756, it is likely the better choice.

TS-870 reveiwed in Feb 96 QST. IC-756 reviewed in May 1997 QST.

Cost difference may be because in newer radios you seem to get more for less $$. And the IC-756 is a newer radio.

I hasten to add that I'm a real fan of Kenwood (have a 507D, now -- reviewed in Jan 97 QST).

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-09 00:00:00 UTC
From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <33EC81C4.3213@ix.netcom.com>
Source record: 168422

Ed,

I have experienced the same problem (and with other applications of those long, in-line batterey holders as well -- apparently there is too much force on the ends and they break out).

For my MFJ analyzer I went to my local electronics store and got two squarish units that hold the batteries in parallel (wired in series) and attached them to the "floor" of the MFJ case with Velcro tape. They fit under the electronics and so far, so good.

Mfr is Philmore, I beleive.

BTW -- not a defender of MFJ; they design good stuff but clearly focus is on low cost, not quality in building the designs.

Phil

3272. Power Amp Info; or Mirage and Maha: What I Learned

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-09 00:00:00 UTC
From: jcwren@atlanta.com
Message-ID: <33f17cfb.583246889@nntp.atlanta.com>
Source record: 168423

If anyone's interested, here's what I learned when I went to
buy a dual band amp this week.

The Mirage BD-35 and the Maha MH-A201 are identical units.
LED for LED, screw hole for screw hole, electronics for electronics.

The Mirage had a less "finished" appearance. One for the
screw holes for the bottom plate was stripped, and neither were tight.
The power switch felt a little loose (not a nice solid CLICK, like
you'd like to hear) The manual, while having slightly more information
(although no revalations), had alternating pages printed upside down.

The Maha had a more "finished" appearance. While the power
switch was the same on the Maha, it felt a little bit better. It
could probably be improved. The manual was better typeset, and was
assembled correctly. Maha also claims ISO 9002 compliance, while
Mirage does not.

The amps are exactly the same price, but I'd say that the
Mirage has defintely been "MFJ'ed". They're cutting corners on
assembly, and it's showing.

Both amps have a really idiotic way of mounting them. There's
a U-shaped bracket in the box, and a long screw that can run either
the width or the length of the amp. Neither manual had instructions
on the way to use it, but the only method that seems viable is the
ears of the U-clamp squeeze the top heatsink rail of the amp by
tightening the long screw. Other than this, any other configuration
scratches up the amp, and there are no slots for the U-clamp ears to
be inserted into. Whatever the case, the bracket makes for a very
unstable mounting system. I surprised the bottom plate of the amp
isn't slotted, and a flat pan bracket with 4 small tabs to go into
those slots wasn't used. The supplied bracket requires the thickness
of the amp * 2 in clearance, where a flat pan bracket would add about
1/4 of an inch.

I've recently bought a Maha battery for my HT (an Icom W2A),
and spoke with the technical support people a couple times regarding
my (unheard) of BC-80 charger, and if it would work with a NIMH
battery or not. While they weren't familiar with my charger, they
pointed out all the conditions to look for, what kind of charger would
be best, and what chargers were going to be available soon. They
actually called me back the same day I sent e-mail, which for any
service company these days, seems to be a miracle.

All in all, I think Maha is making a good solid effort to take some market share, and for batteries and dual band amps, I've voted with my dollars.

Side note: While I was considering a rfConcepts amp, it was eliminated for three reasons: HRO had none in stock, the salesman mentioned they had a number of returns, and the output power was too low (20 watts out for 5 watts in on 440, while the Mirage and Maha would make 35+).

A "normal" IF freq, not one that has been invented at 15KHZ or so so it
can be dubbed an IF freq.

Typical normal IF's are at 455KHz, 9MHz, etc. The DSP IF Freq in the
TS-870 is in the 10-20 KHz range, I believe. Think it has to do with
availability of high-speed A/D's at reasonable cost.

: X-NO-ARCHIVE:YES

: Just to let everyone know that Jan 1, 1998 all safety belts will no longer
: be legal for use as a fall protection device (OSHA sub part M). A full body
: harness with appropriate retractable lanyard or ripstop lanyard system will
: be required for anyone over 6' off the ground.

Of course, this reulation only applies to commercial climbers. OSHA has no
authority to regulate Amateurs climbing on their own towers, and there's
nothing illegal about an Amateur buying a new belt and using it
non-commercially after January 1.

What this may mean is a glut of non-harness climbing belts coming onto the
market as the January 1 date gets closer and dealers can't sell their
stock to commercial climbers and others who work off of the ground.

That said, although I don't climb commercially, I just purchased a Klein
full-harness with all the protective features, spending a _lot_ of money on
it. I'm just starting to climb, and frankly...I'm worth it (to me, at least)!

I recommend that others do the same.

I have for sale a collins R-648/ARR-41 receiver.The radio is in very good cond.and very cleen inside.It covers 190-550kc and 2-25mc.The receiver looks like a small R-390 the size of a BC-348.It works very good.It has two collins mechanical filters 1.4 and 6.0 kc.The radio was orig.powered from 28vdc but someone bult an external power supply.The external power supply is connected using the orig. dc connector on the radio. No new holes were added. The radio still has the orig. dynamotor inside it is just disconnected. The radio can be made orig. by just reconnecting the dynamotor and removing an extra wire to the dc connector.
I am asking $190.00 for the radio or trade for a navy direction finder or navy radio.

Define false? The Officer Corps in the military all but requires you to have a a Masters degree to get promoted. So you see a huge number of folks with degrees from "degree mills". These are acrredited programs, but allow you to buy a tremendous amount of transer credit. "Life Style" credit classes. In one case they took money to allow graduate level credit for Undergradute Pilot Training (it's real name) and Squadron Officer's School. As long as you paid the going price per credit hour, they accepted it, or so it seems.

So, in my way of thinking, these are false degrees.

Also, I have run into a graduate of supposedly accredited colleges with a degree in Mathmatics, that failed out in an MBA type of course due to the required math course, matrix algebra. He could not do calculus, so what he did in undergrad school is a mystery.

Thanks
Bert

I have been looking into MBA programs. I run my own company and I am quite
busy. I will not pay for a degree program that wont not gaurantee (in
writing) the issuance of a degree with full payment of the tuition price. I
will not subject myself to a classroom situation in whiuch a random cross
section of professional academics has the power to nulify a portion of the
value of the program by issueing non-passing grades. No degree, no payment
is my ground rules. You would be amazed at the high profile schools that
are willing to accept my money on these terms.

Source record: 168446

Let's think about this. Why should a 15kHz IF be 'fake'? Only due to the ability to reject in band image amongst other things. OK so DSP technology can't work at 'proper' IF (455kHz etc) but so what? The real issue is the dynamic range of the ADC system i.e. most DSPs in radios are 16 bit so limited the dynamic range.
This having been said a DSP radio operating with a 15kHz IF does an EXCELLENT job of cleaning up unwanted signals like spurious carriers very close to the wanted signal. Don't forget that DSP technology allows very high roll off filters.

My IC756 is not the best but it THRASHES a mere mechanical filter rig for ability to remove annoying carriers. Just consider the DSP to be advanced audio processing not a panacea.

Eventually DSPs will operate at higher IFs (they already do but they cost too much) When this happens filters and the like will all be DSP. Mathematical processing is so versatile and precise. What I really want is a 24 bit DSP operating at a few megahertz.

There's nothing "fake" about a low IF. Drake used a low
last IF in its receivers so it could use simple LC networks to
achieve variable passband tuning. Were those radios not using
a real IF?

The important point is that it is before the *demodulator*.
Audio processing occurs *after* the demodulator, IF
processing occurs *before* the demodulator. It's as simple
as that.

Some of the new rigs are also doing demodulation with the DSP.
This can allow considerably more flexibility, and more performance,
than using an ordinary hardware demodulator. A DSP can demodulate
any arbitrary modulation through use of I/Q techniques.

You're right that the reason such a low IF is chosen is because of
the cost of high speed high resolution A/D converters (and DSP
processors, the processor has to be able to perform operations on
the data coming in from the converter, that means it has to have
a clock rate many times the sample rate).

There's a serious cost trade off between speed and resolutionn. Since
resolution maps directly to dynamic range, receiver manufacturers can't
afford to trade it away for speed. So they use a low last IF. 8 bit
flash converters that can operate at several hundred megahertz are
becoming pretty cheap, but that only gives you a dynamic range of 48 db.
16 bit converters give a range of 96 db, but fast 16 bit converters are
still seriously expensive, so slower ones are used at a low IF instead.

And of course, DSP processors which can run at clocks of several hundred MHz don't exactly grow on trees either. Typical DSPs run at a clock rate on the order of 40 MHz. If we assume a clever architecture which allows one instruction per clock cycle, that would only allow us to do 2 instructions per sample with a 10 MHz IF (Nyquist insists that the sample rate be at least 2X, so a 10 MHz IF requires a 20 MHz sample rate). And you can't do much DSP with only two instructions.

There is a trick we can use. We can sample a high IF at 2X the *bandwidth* of the IF. This makes creative use of aliasing to downconvert the signal in the sampling process. Some receivers do this, but it isn't an unalloyed blessing. It places rather stringent demands on the first IF filter to avoid also aliasing the image frequency. And it requires a separate fast sample and hold in front of the A/D converter. That can be challenging to do with low noise.

Cliff,

DSP is great. The DSP in the TS-870 is probably wonderful.

But I believe the radio does not have provision for added mech or xtal filter for CW in the RF IF stages. Serious deficiency in a crowded, high-sig environment (IMHO). Only DSP radio with that "feature" I know of.

Phil

3304. WTT: URC-773, R-1617A for Yaesu FT-70G

I am posting this for a friend who does not have email. If interested email me and I will forward to him.

Looking to sell or trade:

1) URC-773 w/accessories (handset, battery box, antenna), 30-76 MHz in 25kHz steps, has retrans, carrier and 150Hz tone squelch. Runs on D cell batteries

2) R-1617A/USQ-46 surveillance receiver with one seismic sensor (works). Operates in VHF high band
and has display for monitoring sensors. Operates on 12 v.

Looking to obtain a Yaesu FT-70G HF transceiver.

Contact sparkes@fast.net if interested in these items or have a FT-70G for sale

Thanks,

Ned Parkes - N3LKT

There is one guide to "College Degrees by Mail" which remains current. It succeeds "Bear's Guide to earning Nontraditional College Degrees." This is available from Ten Speed Press in Berkeley, California, or some bookstores. Dr. John Bear is the author. This is a fine guide to 100 good schools offering home study degrees, with some or no campus time required.

He also publishes "Bear's Guide to earning College Degrees Nontraditionally, 12th Edition," available only by mail order from C & B Publishing in Benicia, California. Ten Speed Press used to distribute this. The book lists good schools and degree mills.

Steve,

That Collins sounds like a great radio! Now where did I put my checkbook? <Grin>

My problem with the TS-870 is not with the DSP, which is ahead of the AGC I believe -- a very important point. But the radio does not have provisions to add mech or xtal CW filter in the RF freq IF stages. Can cause serious problems in a dense, strong-signal environment.

If you think AES's store in Milwaukee is bad, you should try Orlando, Florida. Customers are treated as interruptions of their daily chat routines. It's what can happen when a store hangs on long enough to be the only game in town. Sad.... Probably the failure of the AES store in Clearwater could be traced to the same "the customer is always wrong" attitude that infects the other stores. Henry Radio's retail operation in Santa Monica went under for some of the same reasons...arrogance and lack of interest in customers, lousy attitude toward the public.

Hell, why don't we just do away with any course work whatsoever?

Won't you feel comfortable being operated by a neuro-surgeon that
has never been stressed out by those nasty homeworks, exams and such?

Let them just plink down their $40,000 or so, sign on the dotted line
(those MBAs that can't write their name can use an 'X' if it is
witnessed)
and give them their sheepskin.

By streamlining the way in which we grant degrees, our universities will
become much more efficient, making our nation even more competitve.

Yes, this is the way of the future.

\end{sarcasm}

Everyone deserves whatever they bargain for. If you are silly enough (as I
was once) to pay for something under the proffered terms, without negotiating
before you give up all your leverage, then you get what you deserve.

>That would be a license to loaf with actually
>studying and working for the degree/certificate being optional.

Perhaps, but what others do is hardly any concern of mine. My basic feeling
is that I can learn everything they teach in the program on my own for next
to nothing (library books and field trip expenses, etc.). The only things
the degree program offers that I would be paying for is the degree itself, the
opportunity to meet other MBA program students/professors/guestlecturers/etc.
(this is the most valuable part), and access to their facvilities (librariers,
athletic facilities, machine shops, etc). I imagine schools can afford to
accept my money on whatever terms I offer, and if they cannot they should
decline to accept my tuituion. Their concerns are not my concerns.

I would imagine that they could develop a completely seprate set of criterion
for acceptance of students like myself that would take care of 99% of their
potential problem. Their problem, not mine. Their problem being acceptance
of students like me might cheapen the degrees they have granted to others.
This is true, it's up to the universities to negotiate in their best interest.
I don't think it would be all that difficyult for them to have their cake
and eat it too. I'll give you two criterion that would probably take care
of it, nobody under 30 years of age with less than 5 years work expereince,
and no financial aid (cash only). I'm sure there are more subtle ways to

weed out those to whom the granting of a degree would diminish the schools reputation, but it's not my concern. It's very simple, *I* *AM* *THE* *CUSTOMER*!! I cannot force any university to sell me a degree on my terms, but they cannot force me to buy one on theirs. A school of business ought to understand this about as well as any institution, as they are constantly preaching the lessons of being responsive to the customer. If I pay the tuition I want the degree even if I never set foot in the classroom, the loss is entirely mine if I choose that course. As it stands I would be perfectly willing to allow the university to fail me if I don't pass their tests but only at an 80% discount! I would be happy to attend a program with no intention or expectation of recieving a diploma so long as the price was adjusted accordingly.

Best regards, Jon Priluck

Don, is this basically a switchable attenuator that you toggle on/off?

My Alinco DJ-G5TH has an attenuator that cuts receive signals by 20 dB and works great for local repeaters when I'm driving thru "intermod alley." Sounds like that's what the "RF squelch" is on the Standard. It is truly a great feature for mobile/base use with an HT, and one that I've hoped manufacturers would start including.

>has never been stressed out by those nasty homeworks, exams and such?

What relation is there between stress on tests and skill in the operating room? I would not like to be operated on by a surgeoun who has never performed surgury before. The fact that our society has allowed the paying universities to position themselvs in such a way as to be the primary filter of competence is something we are already paying for anyway. The number of incompetant idiots with degrees is staggering. If these degree programs are to be the government sanctioned detrmining factor in the acceptance and licensing of particular indiviuals into particular professions then they should not be operated as private, for profit, organizations. Sooner or later this was bound to happen, the purchase of degrees.

>Let them just plink down their $40,000 or so, sign on the dotted line
>(those MBAs that can't write their name can use an 'X' if it is
>witnessed) and give them their sheepskin.

Your confused becuase you think that universities are performing some sort of public service by educating people. I understand why you, why anyone, would think that. Still, it changes nothing, schools are a business and free market pressures will make themselvs felt regardless of the indignation that is likely to be expresses. And given time the quality of education will improve with the increasing market pressure. Schools which fail to recognize the change will go out of business.

>By streamlining the way in which we grant degrees, our universities will
>become much more efficient, making our nation even more competitve.

Your sarcasm is telling. If you change your sentence to read "are able to educate our population" in place of "grant degrees" it does not sound so flippant. The inability to distinguish between the granting of degrees and the effectiveness of learning is epidemic and is a big part of the problem.

>Yes, this is the way of the future.

It really is. At first it will seem like a joke as people buy degrees, but over time market forces and capitalism will have their way. As the customers become more attuned to the fact that it is knowledge and competance which is truly what they desire to purchase those schools who just grant degtrees for a price will decline in stature. Those that effectively convey knowledge and skill will gain prestige. Ultimately the corrupt nature of the University Syetem will be expunged by the sensibility of the students and their desire for knowledge and learning over their desire for formal documentation and empty promises of prosperity. It's hard to see but it's true just the same and nothing is going to stop the trend so you might as well understand it.

Best regards, Jon Priluck

>from a competent person.

I take offense at your insinuation, who are you to decide which is a
legitimate measure of cempetance? Again, I see the confusion inhearent in
the current educational system manifesting itself in your understanding of the
educational system. My "seat" is not being "taken away" from anyone. If
there are others who wish to purchase a degree on different terms it is of
no concern to me. The university only pretends to be selective becuase of
the goverment subsidised tuition system. I can assure you that an *extra*
seat will be created in any classroom anywhere in the world for a cash
customer. I did not take away anything, in fact what I have done is to help
those who canbnot afford the tuition by subsidising their tuition with
mine. There's more than one way to look at these things. You are probably
not able to see beyond the framework in which you have been indoctrinated
despite the fact that you were probably made to read the allegory of the
cave at some point. Sad really. It's not about being capable of earning a
degree, it's about getting what you pay for and exercising your leverage as
a consumer. If the market won't respond that's my problem, I'm not worried.

>I get your drift. Please let us know your business so we can avoid you.

JAMCORP, 17 Jonspin Rd, Wilmington MA, it's in my .sig anyway so I'm not
saying anything new. You most assuredly do not get my drift, your not even
trying :^(Shutting people up and silencing unpopular opinions with sarcasm
and derision is one thing that the current educational system excells at
teaching. It's one of the primary reasons for the paucity of public
discourse in America today.

Besr Regards, Jon Priluck

I didn't think the fit-n-finish on my BD-35 was too bad but then I
didn't find any stripped screws either.
I agree the mounting bracket is a kludge, looks like it was designed as
an afterthought. (Gee, you mean the user wants to mount this somewhere?)
I'm considering buying a Maha MH battery for my ft-51r. How heavy
is the MH battery you bought from Maha in comparison to the original
Ni-Cad?

This is a multi-part message in MIME format.

Hi,

I have a Kenwood TS690s HF radio for sale which has 6m also.
This radio has had the optional Auto-A.T.U. fitted and also the
additional filters (3 no.)

I am throwing in a Manson 30A PSU and a 6m beam.

Immaculate condition (Still in original delivery packaging)

This radio is about 4-5 years old.

Buyer must collect (South Wales or Berkshire region)

contact me at adavies@mcmail.com
0958 380 501 (Mobile) please leave message.

73's DE GW0WXO, Anthony.

Kenwood HF-Transceiver TS-690S

The formidable TS-690S can star in virtually any role with its 100 W transmission

capabilities on the amateur HF bands -- in SSB, CW, AM, FM and FSK modes.

Compact, lightweight construction makes this HF transceiver particularly

suited for DX-peditions. Rugged reliability is matched with leading-edge

electronics: optional automatic antenna tuner, AIP system for improved dynamic

range, Direct Digital Synthesizer for fine (1 Hz) tuning, and the optional

DSP-100 digital signal processor.

Features at a glance:

* 160 m ~ 10 m plus 6 m amateur band operation

* 500 kHz ~ 30 MHz plus 50 ~ 54 MHz general coverage receiver

* DDS (Direct Digital Synthesizer) and digital PLL system

* AIP system

* IF shift function

* AF notch filter

TS-690S: In Detail

AIP system for clearer reception

AIP (Advanced Intercept Point) is a Kenwood-exclusive circuit design that improves the receiver's intermodulation dynamic range to 108 dB. Two RF amplifiers -- one with large gain for enhanced sensitivity, the other with small gain for better intermodulation characteristics -- assure greatly reduced noise floor level.

Ultra-fine tuning (SSB, CW and FSK modes)

Thanks to the Direct Digital Synthesizer (DDS), the operator can fine-tune in 1 Hz steps -- particularly useful for HF packet and AMTOR data communications.

User-friendly Primary function

Beginners and mobile operators will welcome the Primary function, which deactivates all but the most frequently used controls to prevent operational errors.

Heavy-duty cycle design

High-reliability components and a sophisticated cooling system assure circuit stability and make the TS-690S sufficiently rugged for heavy-duty cycle use.

Superior receiver performance and sensitivity

* Triple conversion

Special circuit design, including triple conversion, enhances sensitivity above 24.5 MHz without affecting two-signal characteristics. This means better results when DXing and QSOing in the 24 to 50 MHz bands.

* Selectable IF filter with memory

The operator can choose the ideal IF bandwidth depending on mode, band and QRM conditions. The setting can be stored in memory for later recall.

First-class interference reduction

* IF shift function

This moves the IF passband away from interfering signals while maintaining focus on the target signal, thus maximizing gain and signal-to-noise ratio.

* AF notch filter

A tunable AF notch filter with sharp cutoff characteristics minimizes undesired audio frequencies with surgical-strike precision.

* Dual-mode noise blanker

NB-1 eliminates short duration pulse-type interference such as ignition noise, while NB-2 rejects longer duty cycle noise, such as "Russian woodpecker" interference.

High-caliber CW operations

* Reverse mode

In reverse mode reception is moved away from an interfering signal, so the operator can tune in the target signal from above or below.

* Pitch control

Dedicated CW operators will appreciate this feature which permits the CW pitch to be varied in 50 Hz steps, from 400 to 800 Hz.

Impressive split-frequency operations

* TF-SET and "Delta" F keys

Split-frequency operations are greatly facilitated by the TF-SET (transmit frequency set) key, which can be programmed with the "Delta" F key so that the frequency difference is indicated on the numeric display.

100 memory channels with multi-scan functions

There are 100 memory channels -- all battery-backed and non-volatile -- for storing transmit and receive parameters such as frequency, mode, filter setting, AIP on/off. Of these, the upper 10 memory channels can also be used to hold both limits for the programmable band scan, programmable VFO and store mode, and related data.

Three different scan modes

The operator can scan any or all 100 memory channels, skipping selected channels with a lock-out feature. Group scan divides the 100 channels into

10 groups of 10 for separate scanning. And programmable band scan automatically covers from channel 90 through 99 within the predetermined band limits.

Simple data transfer between two transceivers

If two Kenwood transceivers are hooked up for dual-receive or master/slave operations, data can be transferred automatically via a special cable.

Optional automatic antenna tuner

An optional antenna tuner with microprocessor control automatically establishes the optimum antenna match between 20 and 150 ohms in the 80 through 10 meter bands. A warning beep sounds if a match cannot be found.

Optional digital signal processor (DSP-100)

The DSP-100 digitally processes both incoming and outgoing signals for maximum intelligibility with minimum bandwidth. In SSB operation, unwanted sidebands can be effectively suppressed, while in CW mode the rise and decay times of CW waveforms can be tailored for optimum clarity.

Other Features:

* Digital bar meter and multi-function display
* All-mode squelch circuit
* All-mode RF output power control
* Switchable AGC circuit (SLOW/FAST)
* Direct frequency entry via numeric keypad

3326. Kenwood HF SSB transceiver Model TS-180s

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-10 00:00:00 UTC
From: PD <redbeard@icx.net>
Message-ID: <01bca5dc$76d526c0$010000c0@13>
Source record: 168323
Body handling: Inline uuencoded payload not displayed: TS180.jpg

Kenwood HF SSB transceiver Model TS-180s

FEATURES

1. DFC (Digital Frequency Control). with four tunable memories.

Memories are usable in transmit and or receive modes. Split-frequency operation is possible with the TS-180S VFO and any one of the memories, with the TS-180S VFO and optional VFO-180 external VFO, and with a DFC memory and VFO-180.

Memories can store frequencies from the TS-180S VFO, FIX CH, and VFO-180. Also, frequencies can be transferred between memories.

Memory-shift paddle switches allow any of the memory frequencies to be tuned in 20-Hz steps up or down, slow or fast, with recall of the original stored frequency.

2. High-performance solid-state final stage.

No dipping or loading. Just dial up the frequency, peak the drive, and operate.

High power...200 W PEP/160 W DC input on 160~ 15 meters, and 160 W PEP/140 W DC on 10 meters.

Highly reliable, with large heat sink.

Final transistors (two SRF1714s, each with Pc=250 W) are manufactured by Motorola to Kenwood's specifications.

Double protection circuits. If the SWR is more than 3: 1, transmit power is automatically reduced. Also, if the case temperature of the transmitter output transformer rises abnormally, transmit power is reduced.

3. Covers 160~ 10 meters, with provisions for WARC allocations.

Transceives on 160, 80/75, 40, 20, 15, and all of 10 meters.

Receives WWV on 10 MHz

Adaptable, by installing additional parts, to three new bands, if they should be made available at the World Administrative Radio Conference. AUX 1 and AUX 2 as well as the WWV positions are provided on the BAND switch for this purpose.

The TS-180S VFO covers more than 50 kHz above and below each band, for MARS and other applications, and will thus accommodate shifts and expansion

of existing bands that might be made at WARC.

4. Built-in microprocessor-controlled large digital display .

•Shows actual operating frequency.

•Digital display of memory and of frequency difference. With the DSP/M switch turned on when tho nsP/nIFF switch is depressed, the frequencv that was displayed is memorized and shown at the left side of the digital display, and the difference between the memorized frequency and the new frequency is shown at the right side, continuously changing as the main tuning is changed.

•Blinking decimal points indicate "out of band".

•Monoscale analog dial also provided.

5. Improved dynamic range, with optimum crossmodulation rejection.

•RF AGC, using a PIN diode between the antenna input and RF amplifier. Attenuating is accomplished by the mixer's AGC output, due to superior characteristics of forward bias current versus high-frequency resistance. Thus, the RF-amplifier bias voltage is set automatically for optimum cross-modulation rejection.

•RF attenuator, with fixed AGC voltage for about 20 dB of attenuation.

6. Single-conversion system with highly advanced PLL circuit.

•Uses only one crystal.

•Improved stability and spurious characteristics.

7. Easy-to-use MODE switch.

•Automatic selection of upper and lower sideband by the BANP switch. SSB NORMAL and REVERSE positions on MODE switch.

•CW NARROW and WIDE positions, allowing narrowband operation on CW with the optional YK88C filter•a low-pass audio filter is inserted in the CW positions.

• FSK position for RTTY operation, providing a 170-Hz frequency shift.

8. RF speech processor.

•Increases average audio level and average transmit power by maintaining constant IF amplifier output independent of the microphone output.

• Selectable SLOW and FAST time constants. SLOW (long) time constant provides more natural audio, whereas FAST (short) increases talk power.

9. Dual SSB IF crystal filter system

•Second filter (YK-88S) is optional. IF circuits are common for both transmission and reception.

• Improves signal-to-noise ratio and increases selectivity.

• Provides excellent audio compression when transmitting, while preventing sideband expansion (splatter).

10. Tunable noise blanker (adjusts noise-sampling frequency .)

11. Dual RIT (receiver incremental tuning). Operates on VFO and FIX/MEMORY positions, with separate concentric controls.

12. Variable-pitch CW sidetone (internal adjustment).

13. IF SHIFT moves passband away from interfering signals .

14. Fixed channel (for net and similar applications), when crystal is added. (User supplied).

15. Built-in VOX circuit.

•Automatic transmission by voice. VOX GAIN and DELAY controls on front panel.

• Semiautomatic keying on CW. Time constant automatically 2/3 shorter than on SSB.

1 6. Variety of rear-panel provisions: IF OUT 1, IF OUT 2. . for observing waveforms

XVTR terminal for transverters
ACSY terminal for linear amplifier and other optional accessories
EXT VFO terminal. . . for external VFO
RF ANT for a separate receive antenna
KEY terminal for CW key
RTTY terminal. . for radioteletype FSK operation
SP terminal for external speaker ANTI VOX control for antitrip of transmit from receiver audio during VOX operation

17. Included matching accessories.

•PS-30 base-station power supply.

•YK-88C CW filter

•YK-88S SSB filter

Gary,

Issue on TS-870 is lack of any narrow filter (xtal or mech) in the higher freq IF stages. With DSP THERE, such add-in CW filter would not be needed. Kenwood goofed on that aspect of the design .. and in strong signal environment it will show. Curiously, the 570D does have a CW filter slot.

Phil

For the record,

I've always been well-treated by AES. Any issues have always been resolved fairly and rapidly.

There were some very helpful and friendly folks working the ham counter at Henry too; I think it was an economic thing, not becasue they were not socially correct. Generally, the local stores in California, where the sales tax is over 8%, have a tough time competing with the mail-order guys.

My view is that if you have bad experiences with a vendor, take your business elsewhere. Money talks; on-line bashing counts very little.

Phil

BTW -- I have no relationship, friends, family etc. associated with AES or Henry

He's right you know. Employers don't trust degrees as a measure of competance that's why there has been such a proliferation of personell departments. Their job is to find the good people for their company, and most of them don't check. Not becuase they are lazy but becuase they are not interested really, they are busy developing better metrics. The best is the probation period. Companies want to try you out before they hire you. The degree has taken on significance in the job market which has helped the universities market their product with a fear based campaign aimed at concerned parents. The role of a degree in the job moarket is artificial and there is nothing to stop companies from switching their hiring criterion to something other than degree programs if it suits them better. Many already have. The general reaction to my stated postion on purchasing a degree program is all a result of confusing learning with studying.

Best regards, Jon Priluck

If the Icom 756 has IF DSP then why does the DSP notch filter work after the AGC. For example: You hear a loud Heterodyne and engage the DSP Notch filter. You don't hear the Heterodyne anymore but the S meter still shows it is there. Isn't this after the AGC??

A local ham is looking to sell a Yaesu 726R. He has only the 2M module for it. I'm sort of familiar with the newer 736R, which I really can't afford at present.

Can anyone tell me how the 726R compares to the 736R? Pros and cons both.

Any idea how easy or hard it will be to find other modules for it? I'm interested in 6M and 70cm. And any chance that the 726R would take the modules for the 736R model?

Thanks in advance. John (KB0ZEV)

Attention Arizona Hams!

AzHam is a mailing list (reflector) open to all radio amateurs residing in Arizona (or just interested) for the purpose of enhancing communication throughout the state.

AzHam is NOT allied with any club or organization, but is open to members of any/all such clubs (not required).

News (like Arizona Science Center updates or other) of local interest is welcome:

* Hamfests
* Upcoming Meetings
* Gossip
* Elmering
* Coordination
* Emergencies, assistance
* Hams, Experimenters
* Newbies, Wannabees

We will tolerate some amount of sell/swap, but that is not the intention.

The mailing list is provided by Al Waller K3TKJ at no cost and I (K7ON) do the administrivia (grunt work, and ever so humbly I might add).

To join, send email as follows:

TO: azham@qth.net
SUBJECT:
BODY: subscribe

Please direct any questions to: k7on@qsl.net or k7on@qth.net

Please spread the word to as many folks as you can!

Go to your favourite auto parts store and look for a "battery isolator".
It should include directions for hooking it up. I suspect it's just
a hefty diode plus heat sink.

Yeah! You know, once they put an idiot --Roger Mains of Harlingen, Texas-- in charge of our engineering department..."Doctor" Mains supposedly had a PhD in Tribology (I looked it up: lubrication) given by UT-Austin...he spoused some rather weird concepts, which we, his underlings, just shrugged at at first...then he downsized us, cut our pay, etc., generally f*cked us (the engineers) over...quality went downhill afterwards because of all the stuff he changed...then I checked with UT --its my alma mater--...the man had never shown up there...turns out he was an accountant, or rather had a bookkeeping degree from some fly-by-night technical school...obviously, he had also looked up "tribology' in a dictionary and concluded that a PhD on the subject would have been neat...since Mains had the white hairs, aura, threads, and did not speak English with an accent, etc., he had bullshitted his way into the plant' owner's favor...I was ready to show my findings on Mains' curriculum to the owner, when one day Mains vamoosed...it seems he had been siphoning funds, being an accountant he knew how to do it but the auditors were already after his ass...it turned out to be on Friday, when paychecks are supposed to be issued...Mains was the only one who knew the passwords, etc., of the dinky System 36 we were using to print the payroll checks...it was getting late in the day and the 300 folks on the line were beginning to grumble ("cabrones! where are the checks?")...I, like a noble idiot, stepped into the breach and got the payroll printed...I think some folks got extra zeros in their checks, but what the heck...at least the cholos did not burn the plant down...obviously I was younger and perhaps stupider then, as I really had management by the short hairs and ought to have threatened to format the system 36 unless they gave me a bone...its a war story, that's all.

If your auto parts store doesn't have it, go to an RV place ... they do that all the time (one b--i--g battery to power all the 12VDC accessories in the RV with engine off, one "standard size" battery to start the RV with in the morning) ... I have seen RV's with dual "8-D" heavy duty diesel starting batteries in them for their aux supply.

Those are the terms you accepted, there is nothing wrong with that. You are
also quite realistic about your situation and obviously unconcerned that you
would actually "fail". But imagine that you held opinion which consistantly
unnerved professors and acadmics and that it was difficult for you to
conceal these opinions. Do you think it would impact you ability to earn a
degree under the terms you have accepted. In my case I would be mad to
accept those terms. No faculty I have ever met would be willig to grant me a

degree under any circumstances for reasons that are too complex to go into. i happen to understand the reasons but there are many others who suffer the same fate without the clarity I am fortunate enough to posesss. Their position in life will not be improved until they begin to exercise their purchasing power.

>However, I've noticed that my beloved alma mater is slowly going the same >way....

I have no beef with you, you are very realistic about your education, your degree, and you are observant enough to see what is going on around you in a realistic light. I would ask you to consider if perhaps this could actually be for the best in the long run. Clearly the short term consequences are unnerving but in the long run this should lead to better education for everyone.

Best Regards, Jon Priluck

3353. FT50R: How to open case to fit new button? (any mods while I am there?)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-10 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <01bca522$f9550120$c814c982@kg720cdt>
Source record: 168375

Hi,

I have just received a new PWR buttong for my FT50R. This is the first radio I decided not to mess with hence, I haven't had the back off yet. Could anyone give me some pointers. I am guessing I need to peel the lables of to reveal screws but I don't want to risk it without knowing.

For those interested, the reason I am fitting a new button is because the stock button keeps being activated by accident. I called Yaesu and they sent me a new (supposedly lower profil button). In my opinion the ON/OFF button tining logic is wrong. You need to hold the PWR button in for a second to turn off yet a quick touch turns it on. This should be reversed!!!! Anyway, I would appreciate any guidence in fitting the button. If I need to destroy my lables, I wonder will Yaesu replace them?

While I am in the radio, are there any simple yet useful mods I could do?

Please reply to the group and my e-mail.

Thanks You,

Kevin (KD6QFO)

Hi,

I have had the VX-1R for about a week. I didn't need a new radio but couldn'r resist it. Anyway, for those concidering, GET IT. It is awsome. Great RX, stron TX (even with low power). Features, well, too many to list and easy to use!

If anyone have any other info, let me kow. I would like to make the best of this radio.....

Bob:

I wouldn't push it! Some rigs specify 15 volts as maximum input voltage.
You risk dammage to your equipment.
Your equipment probably would not fail right away, but over time it might.

bridge. (incl. full 800 mhz)
>
>5. Any other +/- comments would be VERY appreciated!

> a) Too many +'s to mention.

b) About the only drawbacks are the obvious (low power 1/2 watt with
battery, 1 watt with 6V external DC. No keypad, although DTMF tones can be
sent via menu or memory, I have accessed autopatch's.) The less obvious is
that it is broken into band segments, Ham VHF, Action 1, Air, UHF TV, etc.
and you can only scan one segment at a time (you can't scan, for example
146 and 440.)

>c) Even on 1/2 watt or less (it has a low power setting), in San Diego I
am able to hit almost every repeater that I can with hit with a full power
H.T. with excellent TX audio. (I will admit the Mountain top repeaters do
help.)

No, you're still going to need ADMS-1D to support the vx-1r. And what you found is correct. You support multiple models by installing in separate directories. The pigtails are different, so that still has to be covered. You also can merge memories between unlike models. I used a file from my FT-50R to do the original load to my FT-8500.

The first several bytes of the .rdf files identify which model they belong to for the software.

Kevin,

Yes you need to peel off the label and remove a couple of screws. I did this to upgrade my TTP to the jazzy one (now standard, I believe).

But I suspect that is the EASY part of the procedure.

I have the "shorter" button. May install it. But I have taken an exacto knife to the one on the radio now and carved it down. Ugly but effective -- so I'm not sure I need to install the "short" one.

Totally agree re the logic being backwards! They got it right on the VX-1R (but not a whole lot else!)

Phil

Cecil. To quote a famous rock song by Led Zepplin, you're "buying a
stairway to heaven", even if it's made of "ladder" line by not wear a
safety harness when climbing towers, or a skid lid when riding a
motorcycle.
OSHA may be one extreme, but, I've seen too many dead bodies here in
Asia
from construction accidents, motorbike fatalities (brains spilling
out everywhere) and the like. I am sure that most fatalities could be
prevented if minimal safety procedures were followed.

Taipei City just instituted a mandatory helmet law for motor scooter
riders.
The death toll from motorcycle injuries dropped by 70%, which means my
tax dollars can be spent on more productive activities rather than
squeegees and mops for the blood and guts cleanup crews. I'm all for
doing things safely, be it with or without OSHA!!!

Please be careful.

I need to buy a portable receiver (shortwave). However, I am not rich. The cheapest one I have been able to find in a Sangean ATS-909 for $257.00. Is it a good deal? Can you suggest the name of another one that is just as good but is not as expensive? Can you suggest the name of a business that sells used shortwave equipment--the business should have a great reputation. Thanks in advance for any help.

: 73, Cecil, W6RCA, OOTC

No.

I don't climb for fun. I climb to get antenna work done, and would prefer
to have the opportunity to get back to the shack and take my risks in the
pileups.

I also don't stick my hands into the amplifier with the HV applied just
because it's "...more of a risk, and therefore more fun..." to replace the
4CX800s that way.

Given that computers are rich in harmonics of the clock(s) that drive
the data and video circuits and that a typical scanner sitting several
feet away from the computer picks up 10's or 100's of birdies from the
computer, I question how good the performance of a card scanner can be.
Put that question directly to the manufactuer and get some hard data.

I can tell you that our climbing safety program does not permit the use
of body belts on the towers any more. Positioning is done in a harness.

> Fall protection is really a separate issue from positioning yourself to
> work (and should be), and, as you say, is an excellent idea.

We require the use of fall preventing and/or fall arresting devices at all times. Fall arresting procedures and equipment are integrated with positioning yourself to work (and should be). Under a comprehensive tower climbing safety program you don't give up one for the other.

Of course amateurs can do whaver they want on THEIR OWN tower. The rest of us can just stand below (clear of the fall zone) and shake our heads.

Yes, one would hope that --

But that wasn't my point. Icom advertises "IF DSP" in the IC-756. Icom DOES NOT advertise "IF inside-the-AGC-loop DSP". So while we may all wish it (in the loop DSP) were so, to make the claim that Icom is being misleading about it doesn't hold water. THAT was the only point of my comment.

There is actually plenty of point in removing heterodynes even AFTER the AGC loop. Of course, if you're trying to copy rare DX at the noise floor of your receiver against a close-in interfering carrier then it matters significantly that the notch be in the loop. If you're trying to cure a headache brought about by a melange of carriers interfering with your 75 meter rag chew, it may not matter so much.

Grant,

The point is that if the hetrodyne can desense the radio by taking over
the AGC, there is little point in "removing" it. You could turn down
the volume and achieve the same results. Optimal DSP would remove it
before the AGC. Audio DSPs do not. One would hope IF AGCs operated
ahead of the AGC.

Frankly, this thread is getting close to a schoolyard arguement. If he looks hard enough Pritluck is going to find a school that will "sell" him the rubber stamp MBA he wants. Thing of it is it will be worth exactly what he is willing to put into it, very little. This IS the way some community colleges are getting and certainly the way lots of those votech's that advertize on latenight tv operate.

Thing of it is what he is asking for is done all the time. Any number of universities hand out degrees to some of the kids they recruit for the sports teams. Large alumi donations get kids admitted when they might not otherwise. Large alumi donations also incourage schools and professors to provide passing grades. no one I have ever heard of has been able to buy high grades which makes me feel a little better :) I think the crux of the situation is that the way Jon presents his request (why was it posted here in the first place?) is kind of vulgar. As far as cheapening the degree, schools that do it too much do cheapen the value of the program, schools that watch it, don't. It's economics in action, how much is he willing to pay? too little and the only schools to accept him are "Bob's school of MBA's" and then the degree isn't worth anything except as a rubber stamp for a career and he's still judged on the quality of work. Willing to pay the big bucks at a school that means something? Takes several years to recoup the expense of the education that he didn't get (more on this in a minute) even if he can stay in a position a few months before he is "downsized" because he can't pull his load.

Some people will check the school, the degree or even his knowlege. most wont. Each group will get more or less what they put into it too. I have always done extensive background checks on prospective employees. I do this not only to verify what they have told me but to get a read on what the person is really like and how they will be 6 mo. later.

As far as Jon's assessment of how schools will evolve:

In article <EErKxC.GA4@world.std.com>, jamcorp@world.std.com (Jonathan Priluck) wrote:

> seprate note, If a university accepts students like me your beef has to be
> with the university, not with me or other students like me. We owe you

He's exactly right. If you employ someone who has "x" degree and they turn out to be a dissapointment (and you checked out their background) call or write a letter to the academic standards board. If you are (or your son or daughter are) a student and see things that are going on that will cheapen your degree do the same and file a letter with your ombudsman.

If you really want to create a stink, there is a board that sets standards and certify's programs (schools), get on their case.

In the end, Universities pay attention to where the big money is coming from. I donate to my alma mater and to several schools that produce good graduates in fields that I hire from. I am not alone in this practice and I definately give small sums in comparison to other companies. These are the people that tell the schools what is needed and the professors want grants to do research so they do it where the money is.

Jon' s mistake in logic is thinking that $40,000 (or $80,000, etc.) will get a school with a good reputation to kiss his ? and give him a contract and let him dictate the terms of his educational program. No school or university that wants to be taken seriously would ever sell a degree so openly.

> >If this was done on a
> >regular basis, fairly soon everybody would know the institutions
diplomas don'>mean diddly.
>
> That's pretty close to where we are now (or where we are heading) anyway.

Not true, institutions reps change all the time based on what the industry sees.

There are schools I hired from years ago that I wouldn't consider without a bunch of backup info on the person now and vice versa.

>
> In my particular case, no. I will probably never work for someone else
> again so the point is moot. I will probably be granted honorary degrees at
> some point wether. Since I do not lie to people I would not be concerned

See, this was a troll in the first place. I read somewhere once that Flip Wilson had an honarary degree in Mechanical Engineering from Texas A&M (I don't know why). Just who would hire him to work in that capacity? Besides, if he want's an Honarary Degree which is just that, he is more than welcome to donate to one of my favorite MBA programs right now at the University of Washington. I am sure they would grant you the honor and even put an award program together if you were willing to cut a check to the school for 50K. It's been done before.

And, as long as you say "I donated 50K and they gave me an honarary MBA" and never jsut say I have an MBA, then you aren't lying. Otherwise you are conveniantly misrepresenting the true facts of the situation regardless of if they ask and that IS lying in my book.

> about fraud. I would not take work from anyone who was concerned about my
> degree without telling them the exact nature of the situatuion. In actuality
> it almost never comes up. Again we've started worrying about what the

Who ever checks. Who ever cares. you aren't talking about looking for a job, you are talking about looking for business for your business. why the heck do you care about an MBA in the first place, if you aren't willing to

sit in a class and learn? as for access to facilities I don't pay to use
University libraries and I'd venture to guess that renting or hiring
facilities to do what you want/need would be a fair bit less than 40K.

> degree infers in the job market. Sad isn't it? That thses two issues
> (education/degree and competance/employment) are so thoroughly tied together.

Gee, it's because they are. if you aren't exposed to the ideas, the
procedures and the process behind different fields of study and work then
you have no common understanding of the field and are incompetent if you
"work" in the field. Schooling takes many forms and a degree doesn't
automatically confer that knowlege but it does imply that that person had
the basics. Better schools= better basics for the average person from each
school.

Hi Gray, the only time that happened was when a friend of mine trusted
his safety belt - it broke and he fell. Luckily, he fell onto soft
ground and high grass and wasn't dismembered.

> Ask your wife/girl friend/son/daughter/best buddy how they would feel...

Well Gray, my wife and son were wearing seat belts when they were killed
in
a car wreck. I wasn't wearing mine. The steering column came through the
seat where my heart would have been if I had been wearing a seat belt.

> They will have to deal with the images in their brains the rest of their
> lives.

I have lived close to the edge all my life. The safe and sane people
have
died all around me and I'm the only one left. I'm the one having to deal
with the image of my wife crushed by the dashboard while trapped in a
seat
belt. I would give anything if she had been thrown free like I was.

Hi all,

I am shortly going to purchase a 35-amp power supply. I was leaning towards the Astron units, but can't decide if I should get the model with the meters on it, versus the "plain" model. Anybody more knowledgable in this area than I (shouldn't be too difficult!) please help me out...

Also, how are the Astron units as power supplies? I've generally heard good things about them, but have been seeing more & more posts about problems with one model or another. Any info here is appreciated.

Thanks in advance.

Tom

3394. FS/FT: Yaesu FTdx-570 HF xcvr

For sale or trade: a nice old Yaesu rig!

Yaesu FTdx-570 HF transceiver, early 1970s all-tube rig,
covers 80/40/20/15/10m, SSB and CW, receives WWV on 15 MHz,
manual says 550 Watts PEP input on SSB, a real powerhouse!
VERY clean condition, no modifications that I can spot, no
bad repairs, etc. I got the rig as part of an estate, and
I have no need for it. I have checked it out on CW and it
works fine, but I haven't checked it on SSB (no mic handy).
I see no reason why it wouldn't work, however. Everything
seems to be in working order. VFO is in good calibration.
The receiver will surprise you (it did me!). Has a narrow
CW filter installed too. I did not test any of the tubes
(performance didn't show me a need to check them).

Oh, one thing, the cooling fan is a bit noisy. I took it
apart and lubed it, but it's still noisier than I'd like.
You could easily replace it with a 3-1/2" computer fan.

A copy of the operator's manual is included (cost me $20!).

Does not include a microphone (they aren't hard to find).
Should work well with most Astatic, Turner, Shure, or E-V
non-amplified desk mics (or most older Yaesu desk mics).

This would be a good starter rig for the newcomer to get
his/her feet wet on HF without putting out a lot of money.
Take this rig, plug it into a 110 VAC outlet, add a key,
a mic, and a suitable antenna, and you're on the air!

Asking $350 plus shipping charges (45 pounds from 75065).
I am open to cash offers.

I'd be interested in trading the FTdx-570 for a clean and
working Drake 2-C / 2-CQ / 2-NT station (does not have to
be "museum quality", just decent looking, and working).

Interested? Email me! I have the rig all packed up and
ready to ship (a previous sale fell through).

From: Robert Lay <w9dmk@crosslink.net>
Message-ID: <01bca69c$6c881d60$8d56f6ce@w9dmk.crosslink.net>
Source record: 168221

Looking for information on HamLink or equivalent functionality. That is, ability to remotely control HF rig and carry on QSO's with it from remote position via 2 mtr HT.

I believe HamLink was being sold by AEA before they went under. If anyone has information on what functionality this equipment had, theory of operation, etc., it would be appreciated.

Also, any such equipment that is available for sale - please describe and quote asking price.

Thanks

Hello everyone...thanks for reading this. I'm a ham who's off to college in a few weeks, and I'm starting to feel like that when I go away I'll be losing the ability to make some decent contacts on the bands.
I would like to hear from hams in the same situation on what they've done to take radio to college with them. Well, I'd like to hear from any hams for that matter. For reference, my room this year is on the first floor of a dorm which has a good northwest view of a large lake (possible lake effects?). Right now, I've got an HF rig which I'm seriously considering getting rid of in favor of a 2m SSB/FM rig and -maybe- a transverter. Is this wise? or not?
Any opinions on microwave? I suppose with Phase 3D, I'd have the chance to make some nice contacts with not a lot of gear, but micro. can be expensive...and who knows when P3D is going up. Anyhow, let me know what you've done, and what you recommend. Thanks and 73's!

>
> -can you set a non standard repeater shift (like 4.6MHz or 3MHz)

Yes, by setting an independent xmit freq in memory. Not sure if you can program the non-standard split for auto-offset use, however.

> -Is the audio loud enough in a car

Depends on the car, I suppose. My thirteen-year-old VW Golf is fairly noisy, especially in summer with the windows down (broken A/C), and my FT8000 (same radio, fixed faceplate, upward firing speaker) is adequate with windows up, not adequate with windows down. This weekend I mounted a speaker above my door just behind the visor, and with this setup the audio is outstanding in all conditions. Interestingly, the speaker came from a hands-free cell-phone installation kit, including a boom mic and power cable, I picked up for $9 at the last hamfest.

> -how sensitive is the out of band reception/

Good, although of course the farther you get out of the ham bands the worse it gets. NOAA weather on 162.5500 comes in better with my FT-530 with the same antenna. My local PD on 860.2625 is much better with my scanner and rubber duckie than with the FT8000 and Larsen dual band glass mount -- although the sharp bandwidth of the antenna comes into play here, too. BTW, intermod rejection is excellent in my experience.

>
> thanks
> Sean

Anyway, FT8000 or FT8100, great radios, IMHO. Highly recommended.

<snip>
> Kevin (KD6QFO)
> brumey@ns.net

I replaced the button on mine a couple of weeks ago. Here's how I did
it.

Remove the battery pack and carefully peel off the lower label, the one
that says "Contains Nickle-Cadmium Battery". Loosen the two screws on
either side of the access area about 5 or 6 turns and press the keypad
out through the front by pushing on the screws. Watch out for the rubber
gasket around the keypad.

Remove the screws, keypad and gasket. Remove the antenna and pop out
both of the rubber protection plugs (MIC/EAR and EXT DC). Pull off both
knobs.

At the edge of the case on either side of the screw access opening there
are tabs on the metal heatsink. Gently pry the outer case apart and pop
the bottom of the radio out of the case. While lifting the bottom of the
radio out of the case, pull the radio down and out of the top of the
case.
Be extra careful of the knob shaft and antenna connector. Also watch out
for the plastic light diffuser (TX LED)in the top of the case and the
rubber gasket.

Just push the old power button through the case from the front. The new
one
pops right back in. (It's 3/32" shorter than the original)

Reverse the steps to re-assemble. Be extra careful of the gaskets and
the
side buttons. Check the radio for correct operation before you screw the
keypad back on. If the radio reports an error or doesn't seem to
operate,
it's most likely that one of the side button are stuck. (mine was)

The new key works great. My radio hasn't got bumped on once since the
fix,

including a 1200 mile road trip bouncing around in a carry bag in the
back
seat. Good luck and enjoy your radio.

Joe,

I wouldn't worry about losing the contacts. I became slightly inactive
my senior year in highschool. Majoring in engineering, I found myself
vexed by the normal side-effects of being a freshman in college. Stress
from classes, new enviroment, and longer study hours created mental
problems and stress, which I found that amateur radio was able to
relieve.

My rediscovery with amateur radio, last spring semester was the best
move that I've made so far. Not only does ham radio give you social
avantages in making new friends in the new area of your residence, but
also gives your brain a chance to totally forget about school and think
about something which is fun AND educational. I found this to be
particularly true in things like practicing CW tapes. It takes total
mental concentration to push yourself to new heights in code (no matter
how fast you are now), and for me at least, allows me to forget about
that pesty calculus!!

Also, those brick walls that you see EVERY DAY kind of gets you in a
rut. Go to the local club meetings and see what its like "on the other
side of the tracks".

Let me know how things go. Also, luckily, many hams are conservatives.
This is an oportune time to get the liberal crap which will clog your
head from time to time!! :-)

In article <5sm6gn$h74$1@news.sas.ab.ca>,

>: Everyone deserves whatever they bargain for. If you are silly enough (as I
>: was once) to pay for something under the proffered terms, without negotiatin
>: before you give up all your leverage, then you get what you deserve.
>
>What's there to bargain? One is paying for the **privilege** of
>attending, not the right.

Remind me not to hire you as a negotiator :^) You bargain for whatever you
can get. It's not that complicated. You just walk in with your cash and
start asking for consessions. If you can't reach an agreement you move on
to another school. Perhaps you should consider a class in bargaining.

If you are worried about the university, don't be. The university is
perfectly welcome to take a hard line and forgo my business. I'm not sure
what your distinction is between priviledge and right. Both can be
purchased, both can be granted.

>: athletic facilities, machine shops, etc). I imagine schools can afford to
>: accept my money on whatever terms I offer, and if they cannot they should
>: decline to accept my tuituion. Their concerns are not my concerns.
>
>Since you believe you can learn everything on your own, why are you
>concerned about having the degree?

I'm not. If I can purchase it at a low enough cost it has some benfits
becuase of other peoples percerptions, particularly so in Europe. The main
reason I am concerned is becuase it has a high percieved value. As a
negotiator I realize this means I can win major consessions so long as I am
willing to give up the degree.

>As for the hob-nobbing, isn't paying
>to do so rather expensive socializing?

You can never know too many people or have too many freinds. And it would
be rather expensive if I didn't win huge consessons for forbearance of the
degree.

>And if you're paying for a piece
>of paper, isn't it a tad costly?

Yup :^) If I pay what you would pay it would be an insane manuever. on the
other hand if I can drive a harder bargain it migh not be so expensive. And
the only way to find out is to show up with your checkbook and start

negotiating.

>: of students like me might cheapen the degrees they have granted to others.
>: This is true, it's up to the universities to negotiate in their best interest.
>
>So, since you're unwilling to accept their standards, you figure that such
>institutions should bow down to you? Something doesn't sound right
>here....

You are missing the point. They are non bowing down to me nor I to them.
We are simply recognizing that I (or any student) can shop elsewhere.

>: I don't think it would be all that difficyult for them to have their cake
>: and eat it too. I'll give you two criterion that would probably take care
>: of it, nobody under 30 years of age with less than 5 years work expereince,
>: and no financial aid (cash only). I'm sure there are more subtle ways to
>: weed out those to whom the granting of a degree would diminish the schools
>: reputation, but it's not my concern. It's very simple, *I* *AM* *THE*
>: *CUSTOMER*!!
>
>I've been in and out of university for over half my life and I would be
>insulted to be considered a "customer".

O.K., that's your perogative. Not everyone feels that way. I assure you I
am not alone on this.

>Being a STUDENT is not a business
>transaction.

Yes it is. Unless you choose to learn on your own, in which case you can do
as you please. But Universities are businesses. Simply denying this fact
will not change anything. Being a student, as you phrase it, sounds more
like a state of mind. In that sense being a student is not a business
transaction, but that's a different argument all together.

>By undertaking studies, as I am right now towards my Ph. D.,
>I accept *their* terms and standards and am perfectly willing to abide by
>them.
>
>If one is unwilling to abide by them, there's lots more who would gladly
>do so.

Maybe. Maybe not. That is something which would affect the bargaining
position of the university quite seriously. In fact there are many students
but there are even more schools. It's a market.

>: no intention or expectation of recieving a diploma so long as the price was
>: adjusted accordingly.
>
>Being a student is a gamble. There are no guarantees that one will pass
>an exam or a course.

That's your deal. I would not buy into such an arrangement a second time. Ifthe fact that I am able to negotiate a different deal than you got offends you then you should take it up with the university, not with me.

>However, if one has the intellectual ability *and*
>the desire, they can not only learn, but they can pass, possibly even at a
>respectable level.

My objectives are very different from yours, as is my style of learning. The inflexible system that you describe is suitable (in my estimation) for about 30% of the population. As in any market, a 30% market share makes you the marke leader. But even the market leader has 70% of the customers who use someone else. You are undoubtedly very well educated, and therefore highly bought in to the system. I don't fit quite as well as you do, so I make my own rules where I can. I'm probably a hell of a lot more agressive than you are, which is just genetics. Each of us is deal a different hand. For 70% of us that means not a whole hell of a lot of academic advancement within the current system.

>So, if somebody not suited for a particular course of study doesn't pass,
>they simply don't belong there. But your argument is that they deserve a
>*discount* for failing. Something doesn't add up here.

No. They deserve a fair deal. That means they get whatever they agreed on. The reason I won't put up with the current system is my business not yours. You shouldn't let my deal affect yours, you pass on your terms, good for you. I don't care what your deal is, why should you care about mine?

Clear Case 1952 Hallicrafters Radio:

This rare and unusual radio is pictured on the cover and on page 170 of Chuck Dachis&#65533; book &#65533;Radios by Hallicrafters&#65533;. The clear case was used to show customers the new printed circuit board being used in the ATCL series of radios. Chuck Dachis assigned the model number CPCR-1 since it was not a production model. This particular radio came from a dealer in Portland, Oregon and the original pamphlet is still with the set. It is in extremely fine physical and working condition. Send your purchase bid to: Rog42@aol.com.

There's no definition I'm aware of that says that "IF" implies "inside the AGC loop". Whether its inside the loop at 455KHz or outside the loop at 11KHz (or whatever the last "IF" frequency is) it is still quite properly an "IF notch".

So the notch is outside the AGC loop. So what, other than the potential for yet another heated discussion and related flame bait, is the point?

hi first the cable tv wire is 75 ohm (WRONG) you need rg58,rg8 or mini 8
cable 50 ohm - try to place outside your antenna best roof mount or side
mount sideing wood & nail ect do not help. and earth ground your
antenna (to a ground rod or {COLD WATER PIPE !! })AND LAST try to get
a good power supply i'll bet the train transformer has hum & lo amp good
luck good day charlie

Source record: 168259

Thank all of you that responded for the helpful input regarding husband's radio/linear interference with our TV's & VCRs. Sorry I didn't get back sooner (kid's 4-H livestock at county fair for 10 days). I enjoyed the input & learned a good bit about interference causes & cures. In the end, the husband moved his antenna out into the field about 100' from the house & maybe 20' feet higher than it was on the roof. This alleviated the problem with the TVs & VCRs (one TV did blow the power supply...luckily the small TV); made the husband feel clever at having "solved the problem & now I can talk when I want & not bother you & the kids"; shut me up about blowing up the electronics; and made the kids feel a little sheepish about not believing Dad knew anything about his radio--"Wow, Dad, moving the antenna really did work."
HOWEVER, I saved all of your suggestions & comments for the husband's future reference, because when the kids hear Dad on _their_ rock & country radio stations early in the morning and try to hear the kid on the other end of the phone while Dad is talking, I suspect there will be some more complaints......

Thank you all again

Jonathan Priluck (jamcorp@world.std.com) wrote:

<snip>

: >Does this mean that anybody and everybody who pays tuition *deserves* a
: >piece of paper in the end?

: Everyone deserves whatever they bargain for. If you are silly enough (as I
: was once) to pay for something under the proffered terms, without negotiating
: before you give up all your leverage, then you get what you deserve.

What's there to bargain? One is paying for the **privilege** of
attending, not the right.

: >That would be a license to loaf with actually
: >studying and working for the degree/certificate being optional.

: Perhaps, but what others do is hardly any concern of mine. My basic feeling
: is that I can learn everything they teach in the program on my own for next
: to nothing (library books and field trip expenses, etc.). The only things
: the degree program offers that I would be paying for is the degree itself, the
: opportunity to meet other MBA program students/professors/guestlecturers/etc.
: (this is the most valuable part), and access to their facvilities (librariers,
: athletic facilities, machine shops, etc). I imagine schools can afford to
: accept my money on whatever terms I offer, and if they cannot they should
: decline to accept my tuituion. Their concerns are not my concerns.

Since you believe you can learn everything on your own, why are you
concerned about having the degree? As for the hob-nobbing, isn't paying
to do so rather expensive socializing? And if you're paying for a piece
of paper, isn't it a tad costly?

: I would imagine that they could develop a completely seprate set of criterion
: for acceptance of students like myself that would take care of 99% of their
: potential problem. Their problem, not mine. Their problem being acceptance
: of students like me might cheapen the degrees they have granted to others.
: This is true, it's up to the universities to negotiate in their best interest.

So, since you're unwilling to accept their standards, you figure that such
institutions should bow down to you? Something doesn't sound right
here....

: I don't think it would be all that difficyult for them to have their cake
: and eat it too. I'll give you two criterion that would probably take care
: of it, nobody under 30 years of age with less than 5 years work expereince,

: and no financial aid (cash only). I'm sure there are more subtle ways to
: weed out those to whom the granting of a degree would diminish the schools
: reputation, but it's not my concern. It's very simple, *I* *AM* *THE*
: *CUSTOMER*!!

I've been in and out of university for over half my life and I would be
insulted to be considered a "customer". Being a STUDENT is not a business
transaction. By undertaking studies, as I am right now towards my Ph. D.,
I accept *their* terms and standards and am perfectly willing to abide by
them.

If one is unwilling to abide by them, there's lots more who would gladly
do so.

: I cannot force any university to sell me a degree on my terms,
: but they cannot force me to buy one on theirs. A school of business ought to
: understand this about as well as any institution, as they are constantly
: preaching the lessons of being responsive to the customer. If I pay the
: tuition I want the degree even if I never set foot in the classroom, the
: loss is entirely mine if I choose that course. As it stands I would be
: perfectly willing to allow the university to fail me if I don't pass their
: tests but only at an 80% discount! I would be happy to attend a program with
: no intention or expectation of recieving a diploma so long as the price was
: adjusted accordingly.

Being a student is a gamble. There are no guarantees that one will pass
an exam or a course. However, if one has the intellectual ability *and*
the desire, they can not only learn, but they can pass, possibly even at a
respectable level.

So, if somebody not suited for a particular course of study doesn't pass,
they simply don't belong there. But your argument is that they deserve a
discount for failing. Something doesn't add up here.

Jonathan Priluck (jamcorp@world.std.com) wrote:

<snip>

: >Won't you feel comfortable being operated by a neuro-surgeon that
: >has never been stressed out by those nasty homeworks, exams and such?

: What relation is there between stress on tests and skill in the operating
: room? I would not like to be operated on by a surgeoun who has never
: performed surgury before. The fact that our society has allowed the paying
: universities to position themselvs in such a way as to be the primary filter
: of competence is something we are already paying for anyway. The number of
: incompetant idiots with degrees is staggering. If these degree programs are
: to be the government sanctioned detrmining factor in the acceptance and
: licensing of particular indiviuals into particular professions then they
: should not be operated as private, for profit, organizations. Sooner or
: later this was bound to happen, the purchase of degrees.

Isn't that what professional regulatory bodies are for? I am a
professional engineer and, in addition to showing that I have the academic
qualifications to practice my profession, I have to show that I'm also
familiar with the appropriate rules and regulations as well as being
competent in what I do.

: >Let them just plink down their $40,000 or so, sign on the dotted line
: >(those MBAs that can't write their name can use an 'X' if it is
: >witnessed) and give them their sheepskin.

: Your confused becuase you think that universities are performing some sort
: of public service by educating people. I understand why you, why anyone,
: would think that. Still, it changes nothing, schools are a business and
: free market pressures will make themselvs felt regardless of the indignation
: that is likely to be expresses. And given time the quality of education will
: improve with the increasing market pressure. Schools which fail to
: recognize the change will go out of business.

So you're saying that a university degree should be a job ticket? With
that thinking, education in the liberal arts would be abolished.

Aren't we forgetting something fundamental here? Weren't universities
established to teach people how to *think* and be good citizens? I find
the tendency of governments to turn them into vocational schools alarming.

: >By streamlining the way in which we grant degrees, our universities will
: >become much more efficient, making our nation even more competitve.

: Your sarcasm is telling. If you change your sentence to read "are able to
: educate our population" in place of "grant degrees" it does not sound so
: flippant. The inability to distinguish between the granting of degrees and
: the effectiveness of learning is epidemic and is a big part of the problem.

It always has been and always will be. It's called human nature.

: >Yes, this is the way of the future.

: It really is. At first it will seem like a joke as people buy degrees, but
: over time market forces and capitalism will have their way. As the
: customers become more attuned to the fact that it is knowledge and
: competance which is truly what they desire to purchase those schools who
: just grant degtrees for a price will decline in stature. Those that
: effectively convey knowledge and skill will gain prestige. Ultimately the
: corrupt nature of the University Syetem will be expunged by the sensibility
: of the students and their desire for knowledge and learning over their
: desire for formal documentation and empty promises of prosperity. It's hard
: to see but it's true just the same and nothing is going to stop the trend so
: you might as well understand it.

And what effect will this have on human society? It hardly bears thinking
about.

<snip>

: >Right - if you aren't capable of earning a degree, why should you pay for
: >the use of the facilities, staff, overhead, etc. while you took a seat away
: >from a competent person.

: I take offense at your insinuation, who are you to decide which is a
: legitimate measure of cempetance? Again, I see the confusion inhearent in
: the current educational system manifesting itself in your understanding of the
: educational system.

Isn't that why we have governments and regulatory bodies? The
professional faculties, such as engineering, law, and medicine, are part
of that system.

: My "seat" is not being "taken away" from anyone. If
: there are others who wish to purchase a degree on different terms it is of
: no concern to me.

I teach at a local technical institute and I come across a lot of people
who shouldn't be there because somebody's bankrolling them. It's a sad
sight to see someone who's wasting their time when their spot could be
filled by somebody who not only has the talent but the desire to learn.

: The university only pretends to be selective becuase of
: the goverment subsidised tuition system. I can assure you that an *extra*
: seat will be created in any classroom anywhere in the world for a cash
: customer.

That sort of thinking is killing my alma mater. It's a university
designed for 20,000 students. Over 30,000 attend, and the results are a
disaster. Lecture halls are overcrowded, lab space is scarce, and the
students don't get as much individual attention as they deserve.

So much for creating "extra seats" for whoever can pay for them....

: I did not take away anything, in fact what I have done is to help
: those who canbnot afford the tuition by subsidising their tuition with
: mine. There's more than one way to look at these things. You are probably
: not able to see beyond the framework in which you have been indoctrinated
: despite the fact that you were probably made to read the allegory of the
: cave at some point. Sad really.

It's called acting in the public good, something which the neo-cons would dearly like to disregard.

: It's not about being capable of earning a
: degree, it's about getting what you pay for and exercising your leverage as
: a consumer. If the market won't respond that's my problem, I'm not worried.

I can see it now. A 2-for-1 sale at a university--pay for one differential solution and get two....

Hi,

I'm looking for some opinions and answers on the Kenwood 2m All-mode
TM-255E.

- Do you miss the variable power possibility, if I'm correct it only has a
switch for 5W or full power ?
- What is the smallest step frequency for the different modes (FM and SSB),
and does it have another step frequency for the sattelite segment (145.800
- 146.000) than 5Khz ?

$600 is a good price in any case, but not as good if it's not
a FT-890AT. The tuner on this radio is *really* good. It'll just
about tune up a coat hanger wire stuck on the back. I'd really
recommend getting the AT model over a non-AT. It will also help the
resale value if you decide to sell it later.

-snip-

Thats right. They start issuing rubber stamp diplomas to people like you
and
pretty soon NO diploma is worth anything.

-snip-
> If I pay the
> tuition I want the degree even if I never set foot in the classroom, the
> loss is entirely mine if I choose that course.
-snip-

No, granting you a degree in such circumstances would substantially hurt
the reputation of the institution that issued it. If this was done on a
regular
basis, fairly soon everybody would know the institutions diplomas don't
mean diddly.

This implies it also hurts those who attend the institution later and DO
actually
do the work, learn, etc.

Are you at all bothered by the fact that you would probably be
perpetrating a fraud
on the clients who look at your diploma and think it actually means
something?

John P. Toscano (tosca005@tosca005.email.umn.edu) wrote:
: A local ham is looking to sell a Yaesu 726R. He has only the 2M module
: for it. I'm sort of familiar with the newer 736R, which I really can't
: afford at present.

: Can anyone tell me how the 726R compares to the 736R? Pros and cons
: both.

IMHO the 736 is the better all around radio. It has 100 memories that
remember splits, ctcss, etc. It comes out of the box with sattelite
support, 2m, and 430-450 coverage.

The 726 has better tuning, but it only has 8 memories. The memories DO
NOT memorize splits, and AFIK it had no ctcss (though you could add an
aftermarket board). The radio holds 3 modules, they were available in
2m, 439.999, 440-449.999 and 20-30 MHZ. It also could hold an additional
sattelite module that allowed you full duplex operation.

If I had unlimited funds and space I would have a 726 for 2m, 6m, and 432
SSB. I would not use it for FM at all. I would also have a 736 for fm work,
with 2m, 440 and 1296. Here the 6m band is ssb/cw only and 220 does not exist.
For HF, a dedicated HF rig is better.

My biggest complaint about the 726 was that it was all to easy to call
CQ on it on 144.200/143.600 USB.

I don't know what you are being asked to pay for it, but if it only has
the 2m module, it was probably stripped of any other modules. The
originals came as 2m only, but most were not bought without modules.

My guess at a fair price, assuming it works properly, would be $400.
Keep in mind that a used stock 736 which comes with 2m, 430-450 and full
duplex (sattelite) can be had for about $1,000. The usual asking price
is in the $1200-$1300 range, but you can bargin.

: Any idea how easy or hard it will be to find other modules for it?
: I'm interested in 6M and 70cm. And any chance that the 726R would
: take the modules for the 736R model?

The modules are rare, with 430-440 being the most common. They go for
about $250 each, used in working condidtion. If you want 430 to 450
coverage, you must add 2 modules. Sattelite boards go for about $100,
but since the supply is very small (it's probably the most wanted) you
may have to pay $200 or more.

A complete working radio with 2m, 430 and sattelite board sells for about
$800. Again you can bargain.

73,

Geoff.

John. I have a FT726R with the 2 meter, 430, and satellite board. It works ok. I have a friend with a 736R and I think it is on par with that radio. Neither rig has a real good receiver - they are prone to overload by strong signals in the passband. I know that the Icom 275 and 271 series have a better receiver, but are single band only. Unfortueately modules are next to impossible to find for the FT726R and 736R modules do not work in the rig. If you can find a FT726 loaded with all the options you want for a decent price it might be worth your while. The Icom 706 has made this rig less desireable because it gives you hf, 2m allmode, and 6m allmode at 100 watts for a very reasonable price. Good luck in finding the rig you want! --- Steve N9ROU

Hi there
I have for sale a Kenwood TH-28A 2 meter portable only 2 months old. It has been modified for extended transmit and receive without cutting out diodes. It comes with a high power battery and the ME-1 memory expansion unit that gives 240 channels. The asking price is $225. U.S. or $300. Canadian and I pay shipping. For Canadian bidders. I would be interested in trading for a used HF transceiver in the Yaesu FT-101 class. I would accept to pay a price difference depending on the offers I get. Contact me by email.

That question has been addressed more than once in this forum. Put your query into Dejanews at http://www.dejanews.com and you'll find most of the responses.

> 1. How is the audio, considering the size of the radio?

Actually very good! Even with the soft cover over the radio the X audio
is great, and TX audio is also very good!

>
>
> 2. How fast is the scan rate? Can't find that spec anywhere? Is it
> slow as molasses as some HT's are?

No, not at all. It really scans quite rapidly, although it will only
scan one band at a time. But you can set a Priority channel on another
band for it to check, that way if your "home" repeater is on 2m and you
are scanning on 70cm you will not miss a call.

>
>
> 3. Does the lithium battery REALLY last 19 hrs?
>

I am delighted and surprised at how long the battery does really last.
And it does recharge quite quickly. I have had my unit for about 2
months and only recharged it 3 times. Your mileage may vary.

> 4. Is there a mod to open up the Tx/Rx?
>

Yes, it is quite simple. I can send you the exact mod if you wish. It is

simple to do, and very easy to reverse. When the mod is carried out you
do lose the automatic repeater offset. That is, the radio does not
select the correct offset for the frequency you are on. This is not a
big problem as most users program the channels into memory where the
offsets are stored. I suspect that the mod switches the radio into a
different band plan, perhaps for Europe or Japan.

> 5. Any other +/- comments would be VERY appreciated!
>

Quite frankly this is the only HT that I carry around due to it's small
size. I use my the transceiver in my car and do cross-band repeat when I

need additional distance, works just great. For hamfests, local events, etc. nothing beats it. Here in Western New York you may not always be able to get into the repeater that you want due to it's low power. Again, like the long battery life and quick recharge, small compact size, and wide band receive. I have seen some postings on the reflector commenting on the units inability to scan all bands at once, but frankly

the unit was designed as a HT, not for a scanner. Overall I am delighted

at the quality and construction of the unit, I feel it is a real bargain

for the price! Hope this helps.

BTW, did you used to have a Mercedes Benz automobile? Your name sounds familiar, I believe that I may have serviced your car. I am the owner of

European Performance on Transit Road in Lockport. I recall about 5 or 6 years ago having a customer named Zajac. If it was you, I did not realize that you were a ham at that time. I am wondering who you took your exam from, W2UJR perhaps?

I belong to the Lancaster Amateur Radio Club, we have a technical meeting every Thursday at 7:00PM at the Police and Court complex on Pavement Road in the town of Lancaster. If you want to see and try out my VX-1R in person feel free to stop out some evening.

While I don't agree with everything Mr. Priluck says, I think you have
overstated the opposite case here. It appears that a university has the
right to take your tuition money, provide only incompetent, boring and
ignorant lecturers, a poorly-stocked and organized library, and then
when you fail, it's your fault.

It dos not seem to me to be too unreasonable to say to a U, 'Check me
out and if you don't think you can bring me up to be worthy of a degree,
don't admit me and don't take my money on false pretences.'.

> I'm using a FTT-11 keyboard.

1. Store the receive frequency in the memory channel.
2. Get the transmit frequency in a VFO.
3. Hold F/W for 1/2 second.
4. Quickly press PTT (the manual says to hold it for the next step,
but I don't need to on mine).
5. Press F/W to store it in a memory.

Essentially, storing the transmit frequency is just like storing a regular
frequency, but you press PTT before you store it.

>Thats right. They start issuing rubber stamp diplomas to people like you
>and pretty soon NO diploma is worth anything.

I agree with the assesment, I'm not so positive of the conclusion. In the
short run perhaps this would be the case, but in the long run the system
would evolve to deal with this and more people would be better served. On a
seprate note, If a university accepts students like me your beef has to be
with the university, not with me or other students like me. We owe you
nothing, we owe no allegiance to other student, past present or future. The
university may not be so unencumbered. I do not envy their position over
the next 15 years.

>-snip-
>> If I pay the

>> loss is entirely mine if I choose that course.
>-snip-
>
>No, granting you a degree in such circumstances would substantially hurt
>the reputation of the institution that issued it.

Maybe. I won't disagree with you, I know that you might be correct. I also
know that things have a way of evolving and turing out rather differently
than we predict.

>If this was done on a
>regular basis, fairly soon everybody would know the institutions diplomas don'>mean
diddly.

That's pretty close to where we are now (or where we are heading) anyway.
Whats to lose.

>This implies it also hurts those who attend the institution later and DO
>actually do the work, learn, etc.

That is the univesrities problem, not mine.

>Are you at all bothered by the fact that you would probably be
>perpetrating a fraud on the clients who look at your diploma and think
>it actually means something?

In my particular case, no. I will probably never work for someone else
again so the point is moot. I will probably be granted honorary degrees at
some point wether. Since I do not lie to people I would not be concerned
about fraud. I would not take work from anyone who was concerned about my
degree without telling them the exact nature of the situatuion. In actuality
it almost never comes up. Again we've started worrying about what the
degree infers in the job market. Sad isn't it? That thses two issues
(education/degree and competance/employment) are so thoroughly tied together.

Best Regards, Jon Priluck

Maybe. Or maybe once everyone knew degrees meant nothing society would stop
using them as a measure of job performance. Then there would be no
incentive for people to buy them for the credibility. With that incentive
removed the schools would be left empty for the students who love learning.
The number of incompetant idiots in any given profession would be up to that
profession to deal with. No more university scapegoats. You are a weak
thinker if you cannot imagine more than one outcome resulting from a change
in policy. Your analysis might be right, but the odds are against it. The
number of possible outcomes are staggering.

Hi,

My company sends me to business trip to Austria (Wien) and Germany (Munchen, Munster and maybe Nurnberg), and I would like to use this opportunity to buy an handheld ICOM IC-T7A (or european version T7E).

But, I don't have any fresh copy of CQ-DL or some other ham-radio magazine, so I am not so familiar with the current pricing od this radio, and where it could be found for less money.

By this message I would like to ask, most kindly, if someone could take a look at ham-radio advertisements, and send me by mail some price information of that radio (in DM) as well as address (fax nr.) of ham-radio store where it could be bought.

Thank You very much in advance!

Slobodan, YT1RVS

Hi, I have an Astron RS-35M that I use for my HF station and it works GREAT. This unit has a combination meter on it. A front panel switch selects between volts and amps. In my opinion, Astron makes some of the best general purpose power supplies you can get. Of course if you need something highly regulated such as for a lab grade supply, you may want to go to a Llambda.

As far as whether you should go with a metered unit or a plain Jane. Personally, I would go with a metered unit. You can tell a lot in the event of a problem just by measuring voltage and current.

Wild.
Human nature being whatit is, the plan wouldn't last past the first
eager beaver that walked into it. Kind of like the guy who tried to
commit A.R. on the Burlington Cop Shop many years ago.

From all apppearances outside, it was a small, unpretentious firm,
patronized only by people with late model, quiet cars, who all wore
business suits.

so he walked in and fired a $20 twenty-two into the ceiling and said
"NOBODY MOVES, NOBODY GETS HURT !"
Then he realized he was the only person there who wasn't pointing
a heavy caliber pistol at him.

I think you can safely disregard schools that teach cops.

small colleges that need money? Maybe.
BIG schools with influential patrons, very likely. I know a couple like that,
but I ain't gonna stick my neck out and make enemies more than I must
to make a living.

ciao.

From: Lee Mann <lmann@uucom.com>
Message-ID: <33F0929C.557BCA6@uucom.com>
Source record: 168155

Meters are basically nice to have. I have a 35A Astron without the meters. When I first got the supply (15 yrs ago - a statement to reliability) I kind of wished I had the meter(s) but in all reality the power supply sets down on a shelf and basically out of sight. If I want to know the voltage or current flow I use a VOM. In the time I've had the supply, I havn't experienced an absolute need for the meter(s). The radios and other equipment supplied typically have enough metering to let you know what is going on.

About the only time I could imagine that having the meters would be absolutely necessary would be if you were going to run enough equipment off the supply to push the continuous current flow limits.

I guess the other question might be...do you have the extra bucks for the metered version.

3480. Selling: Unimog Radio Truck with Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-12 00:00:00 UTC
From: Brad Beesley <beesley@primenet.com>
Message-ID: <33F0B308.2259@primenet.com>
Source record: 168157

I am selling a very nice Belgian radio truck that has all the radio gear intact (less transmitter). The Mercedes-Benz Unimog is one of the world's most capable four wheel drive vehicles ever made. Unimogs are used by over 75 countries for their military operations...and are also used by cities and governments for various functions parts are plentiful and cheap. If you would like to find more about Unimogs, see my web page below.

This vehicle is a 1965 S404 Unimog (gasoline). The Radio shelter was replaced in 1982 and the vehicle underwent a complete rebuild by the Mercedes Factory in 1985. The Radio Box portion of the truck makes a superb all terrain camper and has a gasoline heater for those frigid arctic conditions, as well as a separate battery system to run the gear. It is designed to house three or four operators in addition to the driver and co-driver who remain in the cab. All the radio gear is said to be intact, and photos reveal all the cables, and perhaps even the original generator. I don't know anything about radio equipment, so won't be able to answer any questions until I make inspection of the vehicle (September). I would like to sell the vehicle and the radios as a complete unit, so not parting out the radios.

Contact me via e-mail for photos and prices if you are interested.
I can tell you all about Unimog, but don't know about radios, sorry.

Brad Beesley

3482. Computer Control for IC-R72

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-12 00:00:00 UTC
From: "Jason J. Garc&#65533;a" <jjgarcia@linkline.com>
Message-ID: <33F092B2.897AEDC@linkline.com>
Source record: 168159
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.equipment

If you presently control your Icom R72 receiver from a computer, I would like to ask for a couple of minutes of your time and some input on what you use, how well it works and how you like it, and where I can get it for a reasonable price. Since I will be changing the 99-memory databases quite often, loading different frequencies every time, this part of the program becomes maybe my first priority. Please keep that in mind. Thank you.

Now, please, don't hesitate to participate on this one. I will appreciate it. I know that there are not many R72s out there perhaps, but somebody is doing this, I'm sure.

I'm a SWLer and have been purchasing accessories from several AES stores since 1984. My dealings with the company, so far, have always been pleasant. The many people I have talked to there usually have been friendly and informative. This is only my side of the story. I felt compelled to say it. On the other hand, I'm sure that those of you who are complaining about their service have a reason, or more than one, certainly. I respect that.

I can't say the same about the Henry Radio operation and staff. I agree 100% with the comments above. Being from S. CA., I went there in occasions and saw it first hand. I kept wondering how they stayed in business that long! Did they learn a lesson? I doubt it.

Again, this is my experience only. This is still a democratic forum, isn't it?

GET A MANUAL!!!! THATS NUMBER 1 priority!!!! You can order them from
Ericsson GE......

Easy mod to do....BUT there are some other things to do.....here is the
MVP Mod
to duplex it (from a file...I did mine slightly different but this will
do)

These instructions will work for MVP's on any band.

Before you start, test the radio completely to establish a
benchmark for post conversion testing. It is better to find any
problems that exist in the basic radio and fix them now. After
the conversion you only need to find the problems you created.

MVP C.G. encoder/decoders are pretty useless after the radio has
been duplexed so now is a good time to get rid of it. Don't
forget to replace the resistor between H1 and H2 on the System-
Audio-Squelch board (The SAS Board). Most of the duplexing is
done on the SAS board.

1) Remove the System Audio Squelch board from the radio.

2) Cut the printed circuit land that connects J904 pin 2
to U902 pin 7. The best place I've found to do this
is right near U902 pin 7 on the solder side of the
board. There is a land that goes from U902 pin 7 to a
via pad. This trace is only about 1/8" long and is
shown in gray in the MVP manual Outline Diagram. I
use an Exacto knife to make these cuts. Make two cuts
perpendicular to the run of the land about 1/16" apart
then remove the land in between by prying up one end
and pealing the copper away. This disconnects the

receiver oscillator control line so that the U902 no longer can turn the oscillator off during transmit.

3) Place a jumper between J904 pin 1 and pin 2. I do that right at J904 on the solder side of the board. This puts regulated 10V back to the receiver osc. control line so that the oscillator is always enabled.

4) The next cut is a little harder to find. The line on the schematic that connects the junction of CR901, U902 pin 6, and J906 pin 5 to the junction of R905, R906 CR905, C906 and U901 pin 7. On the schematic it's a nice straight vertical line just above U902 but on the board it runs all over the place in and out of via's, from the solder side to the component side and back again. The place I cut it is on the component side of the board near J905. Set the SAS board on the bench with the component side up and the board oriented as shown in the MVP Manual Outline Diagram. On the Outline diagram you can see two component side lands that run parallel along the bottom edge of the board the whole length of J905. The bottom most land connects H16 to J906 pin 4. Don't cut this one... The one you want is the next one up. It kind of looks like and S on the board and runs between J906 pin 5 and a via just below U902 (next to H5). I make the cut near the end (pin 7 end) of J905 before it makes a turn and goes up toward U902. Make the cut as described in 2) above.

5) All of the I/O lines to the radio can be found on the SAS board and should be connected before you put the board back in the radio.

PTT is at H17. This is a ground to transmit line.

COS is at J912. This line is ~0.1V when the radio is squelched and ~9.0V unsquelched. Don't try to run a relay from this COS line. I'd use a CMOS gate to buffer it. If you're useing a modern controller chances are that it uses COMS logic and the buffer isn't required.

Mike in is at J913. This line has mic bias on it and should be capacitor isolated. It takes about 2V P-P to drive the radio to 4.5 Khz deviation.

Receiver audio is found at H16. This is unprocessed audio. It is not squelch gated and is not de-emphasized. There is ~4V P-P with 4 Khz deviation on an on frequency signal applied to the receiver. This should not be loaded by less than a 10K input.

(NOTE: a simple RC ckt of a 6.8K resistor in series and a .2uf cap to ground makes an excellent de-emphasis ckt...put the .2uf cap away from the point which the resistor is tied to the radio and tie the controller here...use HIGH impedance here to prevent loading-

AUDIO OUT -----/\/\/\/\/\-------audio out to controller
6.8k |
--- .2 uf cap

Chris WB5ITT |
GND

6) Put the SAS board back into the radio.

7) Unscrew and unsolder the SO-239 antenna connector and remove it. (If this is a UHF radio I'd throw it away and get an N connector but it's up to you). After the conversion this will be the transmit antenna connector.

8) Unsolder and disconnect the coaxial jumper at H2 on the Filter board. Disconnect P1 (this is the antenna relay control and can be cut off and pulled out of the harness or left alone. It won't do much when you're through).

9) Remove the filter board from the radio.

10) Using solder wick remove as much solder from around the antenna relay can on the component side of the board as possible. Also use solder wick to remove as much solder as possible from the relay pins on the solder side of the board. If you can remove enough solder from around the pins you can break them lose with a small screwdriver of knife when the solder is cold. This will make the relay easier to remove. With a small pair of diagonal cutters grab a corner of the relay can. Using the soldering iron, heat whatever is stuck and remove the relay.

11) Now you need to remake the connection between the output filter and the antenna connector. I use a piece of center conductor from a piece of RG-58 to do this in the hopes that the dielectric and the conductor diameter will keep the impedance about right. This jumper should be placed as close as possible to the circuit board in the holes left by pin 4 and pin 7 of the relay.

12) Now you need to rig up an antenna connector for the receiver. THE MOST IMPORTANT THING HERE IS TO HAVE A CABLE WITH A CONTINUOUS SHIELD from the receiver connector on the front end casting to the antenna connector. This means no voids in the shield around

the connectors at each end. If there are unshielded parts of this assembly the receiver will hear the transmitter and the resulting desense will be unacceptable. Use a good quality connector like a BNC or TNC (or type N if you can make it fit...). I like all of the connectors to come out the back of the radio. This is real handy from the point of view of working on the radio later and looks real nice but is a pain to do.

If you chose to do this (or put an accessory connector on the back panel of the radio) you need to take all the boards out of the radio and mask off the back of the radio from the rest with newspaper and masking tape to keep drill filings from getting into every nook in the sheet metal and causing problems later.

Mount the connector as close to the edge of the cover opening as you can or it will hit the filter board when you put it back in. Make sure whatever connector and coaxial you use for this will make the turn to miss the filter can. You could mount all this stuff on the front (plastic panel) and save yourself a lot of work but it wouldn't look as nice and it only takes time to do it right.

13) If you choose to put an accessory connector on the back panel I suggest you put it near all the other connectors. To make room for this you will need to remove the little sheet metal doodad G.E. decided to put on the back of the radio. Don't forget to mask off the power connector especially around the base where it meets the back panel of the radio. Metal filings like this way of getting into the radio.

(NOTE the front is better to put IO connectors--Chris)

The doodad is held by two spot welds.If you look carefully you can see where they are. Drill these down to the point where the drill is just getting into the back panel. Be careful not to screw up the power connector in the process.

I put the accessory connector next to the power connector. I like 9 pin D type connectors. They are widely available and of good quality. The D shape makes them a pain to mount without a punch (the Greenlee punch for this is >$280.00). Get the connector as close to the edge of the cover cutout as you can. This keeps it up high in the exciter area and out of the way. You are working through two layers of sheet metal so be careful when (if) you tap

the mounting holes as the tap tends to bind between
the layers. Put the radio all back together now.

(NOTE: I used 5 conductor shielded cable to come out NEXT to
the
MIC plug on the MVP for my connections and used a MOLEX to allow
easy removal of the radio from the controller...Chris)

14) Put the output filter board back in and solder the
transmitter antenna connector back to the tab on the
filter board.

15) Retest the radio to make sure it survived the
operation.

NOW, a few extras he left out....IN rptr svc, the MVP gets HOT HOT
HOT!!!!!
The bad thing about this is: when the PA heats up, the exciter below it
also
heats up...this is not THAT bad BUT the temperature compensation ckt
that keeps
the xtals on freq is located on the exciter board....and IT gets
hot...this causes
it to pull the TX xtal back on freq.....BUT at the same time, it pulls
the COOLER
RX xtal OFF freq (as much as 5 Khz!)....to get around this, do the
following:

CUT the temperature compensation line to the RX xtal element (it is a
line with
3.9 V DC nominal on it)...get a 3.9 Zener and a 1K resistor...with this
tied
to the 10V DC line also present on the RX board, now you have a 3.9V
Regulated
voltage that you feed to the cut comp line that goes to the RX xtal...

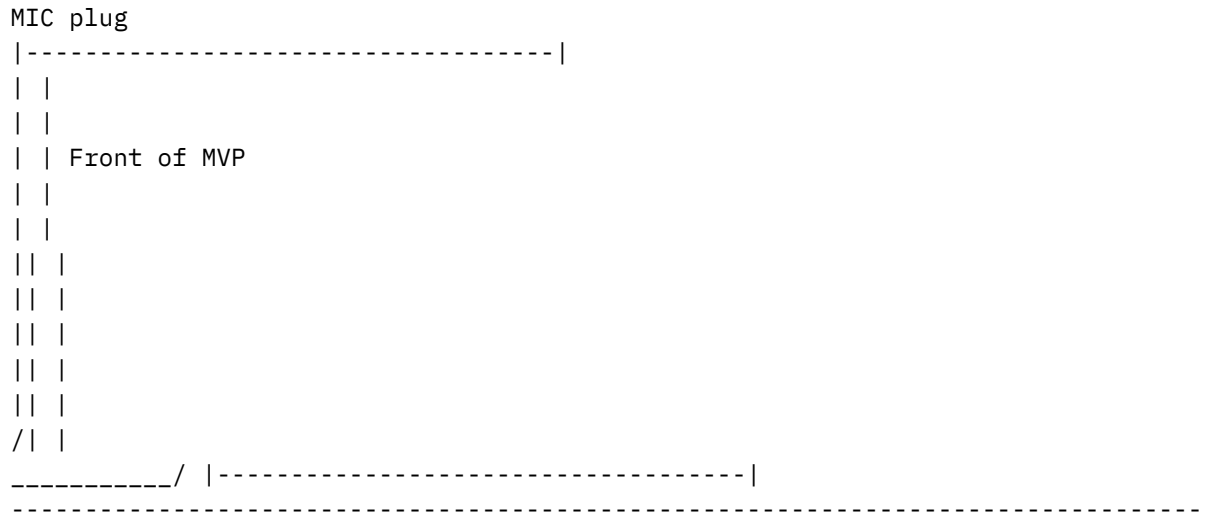
10V DC ------------/\/\/\/\/\---------------->RX xtal
1K {} 3.9 ZENER
|
GND
Sorry for the cheap ascii drawings...

Get your xtals from a GOOD xtal maker (ICM is who I use)....

ALSO to keep the PA cooler, take a piece of THICK aluminum that is
slightly less
tall than the back of the PA section (the flat outside)...drill some
small holes
that you can use sheet metal or self tapping screws in (and make sure
they clear
any PARTS!!!)...Bend the aluminum plate to be flush with the side of the
MVP when
held against the back plate....Make sure you have holes in the plate to

match the
holes in the back of the radio....NOW, Put the case back on the MVP...
coat the plate and the back of the MVP PA area with plenty of heat sink
compound....
MOUNT the plate to the back (it will stick out but the end of it will be
flush
with the side of the MVP...)...mount this assmebly to the back of a
5inch or taller
piece of rack paneling (the mic plug will be away from the panel)....

A TOP view will show this:



NOTE The small aluminum plate that acts as a heat sink
connection...the takes the heat away from the back of the radio and
uses the rack panel as a heat sink....MAKE SURE TO COAT ALL contact
parts
(GE, plate and rack panel) with LOTS of heat sink compound.....
Use a 1/4 in or thicker plate as the connection between the GE
and the rack panel....mine was 1/4inch and easy to bend....

My MVP is still running 20watts out (100% output) since 1989 !!!
using this method (thanks to KE5O for the idea!) and is on the
air on 444.5 in Beaumont, TX....

Used a Hamtronics GasFet preamp and it is the best UHF rptr in town with
a RC 850 tied to it...

73

> Go to: http://www.house.gov/
>
> Do it today.

One thing to note (speaking as one who's had experience raising hell with
congressfolk :)--

I'd strongly recommend anyone talking to congressfolk do it either
through snail-mail or via phone (voice or fax). Most politicians rarely
read their email; usually, they'll have their secretaries handle it or
they'll file it in the garbage. This is partly because in past,
Congressional mailboxes have been mailbombed by folks who don't like
their congresscritters.

You'll prolly get best response if calling by phone, followed by
snail-mail and/or fax. Most phone companies are around 7-10 cents a
minute and some phone companies give discounted rates or even free calls
when calling government numbers (yes, there are entire phone companies
catering to the political activist), and a stamp costs right about 32 cents.

Hi Vince. The pixie2 is described in detail, with all original
text and graphics on my web page. I have obtained permission
to display these, however they are copyrighted.

The pixie2 is easy to build. I bought one at Haltec for $9.95
+ tax. It was so easy, I built a second one that day from
spare parts I had. The second one was ground plane construction
and even works better than the first (PC Board)!

Haltek has them for sure.

Good luck and visit my page (In signature file below).

I have a large switching power supply, Think its a Llambda, to hard to get at to be sure. Added volt and current meters to it where it feeds a distribution bus. These are OK but most meters built into a power supply aren't worth having. Either they aren't accurate enough or the power supply is in some out of the way place where you can't use them.

>Frankly, this thread is getting close to a schoolyard arguement.

No question, I have already started recieving hate mail from Mr. Zawodny who would like to see me "dragged into the streets and shot". Presumably one of the things they no longer teach at University is civics or even good manners.

>If he
>looks hard enough Pritluck is going to find a school that will "sell" him
>the rubber stamp MBA he wants.

Actually I'm not all that interested in the degree, not that anyone asked before they charged down their path of assumptions. I have never stated what my intentions were, or that I was not interested in working at the program or anything else. I just pointed out that I intend to maximize my bargaining power going in. What I will end up with is either a gaurntee of dipolmahood or a significant discount on the cost of the program understanding at the outset that I will not be granted a degree no matyter how much work I do. In fact, that is what I would prefer. The degree has a high percieved value, it is of no value to me at all so I will trade it away for what I consider to be a better deal.

>Thing of it is it will be worth exactly
>what he is willing to put into it, very little.

This is a supremely arrogant assumption. You have never met me and you have no idea what I might do, you never bothered to ask, I see no reason why anyone would take you seriously. For all you know I couild be a stunningly successful materaisl technologist and businessman who's company is worth in excess of 120 million dollars and who has absolutely no need of a diploma for the puroses of employment whatosoever, forever. Then again maybe I'm just a second rate student who is bitter becuase I was not granted a degree and can't find work in my chosen field becuase of it. The point is this.... you don't know. You never asked. You assumed. Many of you are offended by the ideas I have espoused, but I have not attacked you personally (though from the reactions I'm gettting I think many feel personally attacked). I truly do not beleive inthe current educational system. I think it limits peoples potential and does a disservice to the vast majority of those who attend. But that is my opinion, nothing more.

>This IS the way some
>community colleges are getting and certainly the way lots of those

>votech's that advertize on latenight tv operate.

Some have excellent programs, particularly the voc-tech becuase they are teaching skills. I learned today that there are 20,000 unfilled job opportunities for tool and die makes in the US today. The voc tec schools that teach these skills are doing their customersa service. These jobs pay 60-100K per year plus benefits. These jobs are far too difficult and demanding to be filled by your average university graduate who has neither the aptitude nor the skill to do these jobs. Most importantly they do not have the attitude to do these jobs which they havecome to think of a demeaning for some strange reason.

>Thing of it is what he is asking for is done all the time. Any number of
>universities hand out degrees to some of the kids they recruit for the
>sports teams.

In fact it is difficult for any Harvard student or Tufts student to fluk out, that's what the whole grade inflation thing was about. But the illusion that the degree confers some mystical status of having "earned" it is easier to maintain when it is the parent who is supplyinjg the pressure to grant the degree and the student is blissfully unawares. The whole "grade inflation" thing that was making the news a couple of years ago is what I'm talking about. Schools bend over backwards to pass everyone, but they bend over double hard for the children of the priviledged classes who actually pay cash for their kids educations. The scandals erupt every now and again butthey never seem to do much permanent harm to the various institutions. Evefrone is too invested in the way things are to rock the boat too much.

>Large alumi donations get kids admitted when they might not
>otherwise.

No question about it.

>Large alumi donations also incourage schools and professors to
>provide passing grades.

Yup.

>no one I have ever heard of has been able to buy
>high grades which makes me feel a little better :) I think the crux of
>the situation is that the way Jon presents his request (why was it posted
>here in the first place?) is kind of vulgar.

If so I apologize. It is often difficult if not impossible to state such things without someone taking offense. I already knew that many academics consider the market and capitalist ideals in general to be vulgar in and of themselvs. In that respect it cannot be helped. Clearly I'm not making any requests on the newsgroups, but the notion that you can negotiate is something that people ought to be aware of. Otherwise they will be taken advantage of their whole lives. Once you leave the nest there is no-one to look after you except yourself. You should be realistic about the world and what you can offer it and what it can offer you.

>As far as cheapening the
>degree, schools that do it too much do cheapen the value of the program,
>schools that watch it, don't.

I agree. In the long run schools that admit people whom they think will represent them well in the long run as alumnists and who are correct in these choices will also do well. Amongst them will be a certain number of schools that admit only those who are able to negotiate well for themselvs. Ultiamtely this will lead to more choice in education and more options, the "selective" schools that admit based on scolastic aptitude will have to compete with schools that have differnt criteria and the whole system will be more vigorous and vibrant becuase of the competition.

>It's economics in action, how much is he
>willing to pay? too little and the only schools to accept him are "Bob's

>several years to recoup the expense of the education that he didn't get
>(more on this in a minute) even if he can stay in a position a few months
>before he is "downsized" because he can't pull his load.

Not relavant in my (self employed)case but lets take someone else.
Your assumption is that no education was recieved. This probably
means that you assume anyone who
is not threatened with failure is inhearently lazy and will take the path of least resistance. Ask any competant psycologist what transferrence
means. It means that is what you think others would do becuase that is what you think you would do. Others may actually behave differently.
Undoubteldy there will be some students who fit this profile, universities would do well to try and spot these people and let someone else have their business. Agian, the onus in on the admissions officer.

>Some people will check the school, the degree or even his knowlege. most
>wont.

Most will check comopetance in the workplace regardless of any other criteria that may or may not exist.

>Each group will get more or less what they put into it too. I have
>always done extensive background checks on prospective employees. I do
>this not only to verify what they have told me but to get a read on what
>the person is really like and how they will be 6 mo. later.

My company has an open hiring policy we check neither previous job performance nor academic credentials. Instead we just let people work and see what they take to, most just wander off (they are incapable of self-administration, usually becuase they have been through 15-20 years of supervised academic situations). But some take to it like a fish to water, we invest heavily in those people, we help them become vested in the companyand we work to make sure their jobs offer continuois opportunities for growth and learning. And we pay them welll above industry standard.

>If you really want to create a stink, there is a board that sets standards
>and certify's programs (schools), get on their case.

I strongly agree. If you fail to advocate your position then you will get
shoved aside. It's no different than negotiating, if you don't do it nobody
is going to do it for you.

>In the end, Universities pay attention to where the big money is coming
>from. I donate to my alma mater and to several schools that produce good
>graduates in fields that I hire from. I am not alone in this practice and
>I definately give small sums in comparison to other companies. These are

Absolutely correct.

>Jon' s mistake in logic is thinking that $40,000 (or $80,000, etc.) will
>get a school with a good reputation to kiss his?

By now you've probably figured out that has nothing to do with. Basically
you and I agree. there will be schools that accept non-traditional
students, those that don't those that accept whoever pays, in the long run
it's hard to say which will be the best served.

>and give him a contract
>and let him dictate the terms of his educational program.

You know perfectly well that dictate and negotiate are two different
things. I have no direct power over the university therefore I cannot
possible dictate anything.

>No school or
>university that wants to be taken seriously would ever sell a degree so
>openly.

No question. The university would almost certainly insist that I concede to
a gag order befre we closed a deal.

>> >If this was done on a
>> >regular basis, fairly soon everybody would know the institutions
>diplomas don'>mean diddly.
>>

>> That's pretty close to where we are now (or where we are heading) anyway.
>
>Not true, institutions reps change all the time based on what the industry sees.
>
>There are schools I hired from years ago that I wouldn't consider without
>a bunch of backup info on the person now and vice versa.

Yes, but you certainly are not acting blindly.

>> In my particular case, no. I will probably never work for someone else
>> again so the point is moot. I will probably be granted honorary degrees at
>> some point wether. Since I do not lie to people I would not be concerned
>
>See, this was a troll in the first place.

Sort of. It's a pet peeve of mine and occasionally I like to argue. But I
am sincere in my beleifs so I'm not sure if that constitutes a troll.

>I read somewhere once that Flip
>Wilson had an honarary degree in Mechanical Engineering from Texas A&M (I
>don't know why). Just who would hire him to work in that capacity?

Now that's funny :^) :^)

>Besides, if he want's an Honarary Degree which is just that, he is more
>than welcome to donate to one of my favorite MBA programs right now at the
>University of Washington. I am sure they would grant you the honor and
>even put an award program together if you were willing to cut a check to
>the school for 50K. It's been done before.
>
>And, as long as you say "I donated 50K and they gave me an honarary MBA"
>and never jsut say I have an MBA, then you aren't lying.

Exactly! The fact that someone had 50K to donate in the first place (assuming
they did not inherit wealth) and that they were willing to donate it to an
educational institution probably says as much (or more) about that person
as earning a degree in the traditional sense does.

>Otherwise you are
>conveniantly misrepresenting the true facts of the situation regardless of
>if they ask and that IS lying in my book.

Agreed. Ethics is not something any successful businessmand can afford to
skimp on. You live and die by your reputation in the community where you do
business. Misrepresentation and outright lies are basically
indistinguishable. On the other hand, if others make assumptions which you
did not lead them to, that's not your problem nor are you honor bound to
straigten them out.

>> about fraud. I would not take work from anyone who was concerned about my
>> degree without telling them the exact nature of the situatuion. In actuality
>> it almost never comes up. Again we've started worrying about what the
>

>Who ever checks. Who ever cares. you aren't talking about looking for a
>job, you are talking about looking for business for your business. why the
>heck do you care about an MBA in the first place, if you aren't willing to
>sit in a class and learn?

That's just it. I never said I wasn't going to do those thing, people assumed that. I have every intention of taking full advantage of the program if I decide to pay for it. But if they wish to grade me on my performance then I want a discount becuase I am not interested in that portion of the service they provide. I don't need the degree and I don't want to pay for it. If I have to pay for it (since I don't really need or want it anyway) then I want to be assured that I get it. The easy descsion for the university is to accept me as a non-degree seeking student and charge accordingly.

>as for access to facilities I don't pay to use
>University libraries and I'd venture to guess that renting or hiring
>facilities to do what you want/need would be a fair bit less than 40K.

Yes. The question was rhetorical, the point was these things are not worth anything to me, I could buy them cheaper elsewhere (health clubs, public libraries, etc).

>> degree infers in the job market. Sad isn't it? That thses two issues
>> (education/degree and competance/employment) are so thoroughly tied together.
>
>Gee, it's because they are. if you aren't exposed to the ideas, the
>procedures and the process behind different fields of study and work then
>you have no common understanding of the field and are incompetent if you
>"work" in the field.

I guess my answer to that would be that 4 years working in a field is sufficient for any normal person to become quite a valuable asset. The colledge graduate does not compete in the job market with high school grads, they compete with high-scholl grads that have 4 years expereince. When I counsel people I tell them they should go to school as long as they are still trying to figure out what they want to do with their lives. But if you already know, or if you find out tomorrow, get started. As soon as you know what you want school is no longer in your best interest unless you wish to become a professor (no doubt there are other exceptions). Go, get started, as soon as you can.

Schooling takes many forms and a degree doesn't
>automatically confer that knowlege but it does imply that that person had
>the basics. Better schools= better basics for the average person from each
>school.

The option of expereince is highly underrated. The reason being that people are not that agressive. The system does things to peope that don't attend as well as those who do. In some sense the system is opresssive. That can be hard to see and it's a hard case to make. But for those who expereince it it is well understood. People who do not go to school often suffer from

an inferuiority complex that stops them from acheiving many things. If people would just go after te things they desire and admire they would be fine, but most don't. And I'm not sure why.

Best Regards, Jon Priluck

My experience is that Astron power supplies are excellent. The meter question is answered only by your own desire to monitor current drain and regulated voltatge level. For me - meters are manditory = I want to know current flow and voltage. That is all the meters do, let you know the operating parameters, if you want to know the state of the supply and/or the current demands of the equipment, it is the way to go.

cheers.

rick

Folks,
I performed two mods on my FT50.

1) removed the solder blob
2) removed the resistor.

I believe these are two separate mod in that one is MARS/CAP and one is freeband or somesuch.

Does the hex editor mod accomplish both (e.g. open up transmit across more bands (like marine) and enable things in the 800Mhz range? Is the software mod and the two mods I mentioned above identical?

If so, where are the instructions for the software mods? I may need to modify another radio.

>IS THERE A WAY TO LISTEN TO NASA WHEN THEY GO ON SHUTTLE OF IS IT
>IMPOSSIBLE??? SOMEONE LET ME KNOW.

Your best bet is NASA Select (geosat TV feed). The Shuttle relays its communications via the TDRS birds. That's all high rate multiplex digital at microwave, and the antenna on the Shuttle is pointing *away* from the Earth (toward the higher orbit relay sats). TDRS downlinks to White Sands. Selected parts of the TDRS info is then uplinked to the NASA Select geosat (GE2-9) as ordinary TV video and audio for home dish owners (and cable companies) to receive.

Shuttle also has semi-ordinary aviation radios on board for backup if they can't use TDRS, but they normally don't use them. If they are doing EVA, you *might* hear the suit to Shuttle radios (UHF FM) direct, and if they are going to MIR, you can hear them talking to MIR on 143.65 MHz. Of course when they're carrying amateur radio, you can hear *that* easily since it is engineered to be received on the ground by minimally equipped stations (an ordinary HT usually works).

Ditto!

My 726R is currently sitting in a box next to my 736R since I just moved from North Dakota to Minnesota. When I got the 736R, I did some side by side testing on AO-10. My 726R would usually give me a full s-unit more on receive. Since most of the birds I use are so much stronger, I never really compared much on anything else.

The 736r has some nice bells and whistles but I could alway use an extra s-unit while working AO-10 at 25,000km!

Ron,
You can dial-up SGC on the web for a bunch of info.
This was our first amp into the QRO mobile world about a year ago. Some
have said it's too smart for its own good (it's called the Smart Cube)
what with all its protection circuits.
I can tell you in needs a good antenna (get something better than their
own helical or that Outbacker from down your end of the planet) and a
good beefed up power supply in the car to get the best out of it.
It comfortably runs around 600w PEP out on all bands. We've burned out a
couple of Screwdriver 160m coils and formers with this amp so you may
want to try a real mans antenna like the Texas Bugcatcher or maybe roll
your own with airspaced thick wire!
My SGC is now on the back burner having upgraded from QRP!

(((73))) and good luck.

Phil G4ZOW/M 3CX3000A7 /M coming to a town near you.

FOR SALE
CB equipment:
Browning Golden Eagle Mark III three pieces sold as a set $600.00 + shipping. Overall appearance is very good to excellent & it was working when removed from service. There are no books or microphone with it. Each piece has a metal case w/ faux wood grain covering. Front panel & markings on all three units are excellent. The only observed problems with these units are as follows: Receiver has a few light rust spots on the transformers & chs. Transmitter has few light rust spots on the transformer. SSB15 Transmitter has 1 spot of chs rust & there is a good deal of flaking of the faux wood grain case covering on top.

HAM gear.
TMC FFR3 military receiver w/ 8-16mcs tuning drawer. Overall appearance very good. Rack mount. Top cover & power cord missing. Not tested. $150.00 +shipping

National receiver NC300. Overall appearance very good, some paint scratches. Not working, hum only. $200.00 + shipping.

Audio equip
Dyna Mark III mono power amp 1 available priced at $250.00 +shipping (or $190.00 w/o tubes) Overall appearance is very good to excellent, works very good. Has 2 brand new RCA US made 6550's.

Heathkit W5M mono power amp, 1 available priced at $195.00 + shipping. Overall appearance is very good. A little rust on cage, Chs is dirty but no appparent rust & markings are all very good. Some rust on the choke. Has 2 Genelex KT66's, works VG. Missing fuse & cap.

Rogers stereo integrated amp HG88 priced at $200.00 +shipping. Overall appearance is very good but brass front panel has many small spots on it. They will probably polish out ok. Made in London. ECL 86 outputs.. Works very good.

TUBES-All military boxed.
GL 8020 GE $40.00 +. 3 available
6U7G RCA $2.00 +. 15 available
12J5GT SYL VT135 $2.50 ea + 11 available.
717A Western Electric $20.00 ea. 4 available.
+shipping

Prices are fob Baltimore , Md. Offers will be considered on any of the above items.

Source record: 168102

I am looking for a Kenwood TS820S transceiver that is in very good condition and very clean. I would like to look at the rig and see it in operation (if possible) before I buy it, therefore, only hams located within driving distance of Northeastern, Central and Central West Coast of Florida need contact me.

Please send your name, telephone number and asking price if you have such a rig for sale.

>
>Thank you,
>Will

Hi, Will

Here are the Keyboard mods to open up the receiver and use crossband repeat. There are also some surgury mods to extend the transmit frequency range. E-mail me if you want them (unverified).

Gary KN4AQ

To extend the receiver and open up 800 MHz receive (cellular blocked):

-- Turn off the radio

-- Press and hold the band and squelch buttons.

-- Turn on the radio while holding these buttons,
wait for 5 seconds before you release the band
and squelch buttons.

-- Now the receiver should be opened up as far as it will go.

To enable Crossband Repeat:

-- Set the VHF and UHF frequencies you want to use.

-- "Lock" the radio by holding down the CALL/LOCK button
for two seconds.

-- Turn off the radio.

-- Hold down the SQUELCH button (above the PTT button),
the MAIN button and the BAND button.

-- Turn the radio on while holding these buttons. The "LOCK"
indicator (a key icon in the upper right side of the display)
will be flashing, and the radio will be in crossband repeat.

To disable Crossband Repeat:

-- Hold the CALL/LOCK botton down for two seconds. The "LOCK"
indicator will stop flashing, unless...

-- if the crossband repeater is in use, holding the LOCK button
won't turn it off. If you must shut it off in that condition,
press and hold the SQUELCH button, then hold the LOCK button
for two seconds, and the "LOCK" indicator will stop flashing.

3545. FS: For Sale Brand New PRO-2045 in box

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-13 00:00:00 UTC

Got one, after the Comet SMA-3 I had twisted off its base 30 seconds after I had it and opened up as a result. Worked well for 30 seconds, though. The Diamond is apparently better constructed, and I've had great results with other Diamond antennas, both base and HT-types, so I'm confident that it will hang in. Nicely flexible, unlike the Comet and the Yaesu--better receive than the stocker, most apparent on NOAA, but seems to work better on 2m as well. Haven't done any exact measurements. Also, $10 cheaper than the Comet, although seems to have less gain--maybe a couple of dB. I like mine a lot, but what do I know? Did I say I use it with an FT-50?

I am not sure when you bought your brand new IC 271, they were
discontinued about 10 years ago. You spent megabucks on a new multimode
rig that did not work right and did not send it back to get repaired
under warranty?? My friend Al K9WK had a IC275H and a FT736R side by side
in his shack and the Icom had much better selectivity and sensitivity. A
strong 59+ signal on ssb will trash a weak signal 10khz away in either a
FT726R or a FT736R (QST confirmed this in their review of the FT736R)
where their was no problem on the IC275H. I do not use 2m ssb enough to
bother getting a better rig. --- Steve N9ROU

>remote position via 2 mtr HT.
>
>I believe HamLink was being sold by AEA before they went under. If
>anyone has information on what functionality this equipment had,

There were two flavors. HamLink was designed to operate via a
telephone dial-up, and RadioLink connected to another radio to operate
as a remote base. Both work with any Icom having a CI-V port, many
Kenwood rigs, and some Yaesu radios. For HamLink there was an optional
acessory that you could plug a headset/microphone and a keyer for
higher speed cw (this generated a DTMF * over the phone, so speed was
limited about 20 wpm). Both products were developed and sold
originally by another company which AEA bought out shortly after
introduction.

Via DTMF commands, it is possible to directly enter frequencies into
the VFOs, crudely tune up and down the band in various steps, change
modes, browse (but not program) the memory channels, etc. There are
also some logic outputs available to drive relays for controlling
accessories.

I use HamLink with an Icom 706 and it makes a very nice dial-up remote
base, I've even operated it over an autopatch, however it won't work
if the patch disconnects with #.

HamLink controllers show up from time to time on rec.radio.swap, but
RadioLink units are somewhat rarer.

73's All,

We are running a class for the Garland Amateur Radio club and are building the CW on FM code oscillator as seen in the July QST. Now the question is

Where do you find an inexpensive straight key?

I have checked with Mouser, MCM, Radio Shack, Jameco, Digikey ,Tech Americia as well as the local surplus houses in the Dallas/Garland area. Any one have a source?.

Well the word that's going to cause you problems is "inexpensive"...

Your best bet is to advertise for used straight keys in the
rec.radio.swap news group.

The keys advertised in QST are ridiculously high in price for what you
end up with.

Mr. President -
I confess that I do not entirely approve of this Constitution at present, but Sir, I am not sure that I will never approve it: for having lived long, I have experienced many instances of being obliged by better information or fuller consideration, to change opinions even on important subjects, which I once thought right, but found to be otherwise....
....In these sentiments, Sir, I agree to this Constitution,with all its faults, if they are such; because I think a general government necessary for us, and there is no form of goverment but what may be a blessing to the people if well administered; and I believe

further that this is likely to be well administered for a course of years, and can only end in depotism as other forms of have done before it, when the people shall become so corrupted as to need despotic government....

Hmmm, I still like the one about the guy who put helium balloons on his lawn chair. After he was buzzed by a DC-10, he decided to try to pop the balloons to get himself down.

Man, I wish I had saved that one....

Sure. Ameco makes a $10 practice key that is available from both AES and
HRO. It is Ameco Model K-1 and can be found on page 68 of the latest AES
catalog.

Good luck with your class!

In a review of the Yaesu FT-920 in Practical Wireless the reviewer (Rob Mannion G3XFD) rated it second to his ultimate choice of a Kenwood TS-870.

If I were going to completely spoil myself just once in my life would this be the thing to do it with? (I think it's about £2,000 in the U.K.).

The Yaesu FT-1000MP is a similar price, is it as good / better?

What else would do a similar job at around this price?

This would have to literally be a once in a lifetime purchase (unless I win the lottery) and I guess the real cost will be double what I pay since democracy will no doubt demand that my other half will then feel free to look for something for herself at a similar price!

Is there anybody about who has actually got or used a unit at this price level who can define why it's worth about three times the price of a unit with the same coverage?

WOW. I had a brand new IC-271 for about a month. That's how long it took
me to unload it. Talk about a dead receiver! My 726
is not used much, but, holy cow , in comparison, the 726 can hear
Mars and the 271 couldn't hear thunder! Now my old, old FT-221R
has a RECEIVER.

Good Luck,

Bill

>about problems with one model or another. Any info here is
>appreciated.

The only reason you see all the posts about problems with Astrons is because they sell so many supplies! (I'll bet you hear about a lot more problems with Fords than with Yugos too, but that doesn't mean a Yugo is a more reliable car<G>!)

IMHO they're a good, solid & reliable design. And, a simple one that's easy to fix if they do fail. Many competing units use switching regulators, which are often virtually *impossible* to repair. (and expensive to repair if you can fix it)

I don't have meters, haven't felt the need. For powering a transceiver, I wouldn't worry about it unless you're curious & have spare money..

Chris,
You might be interested to learn that both these amp's are manufactured in Taiwan by my buddy Alex in his factory, he also makes some other amp products for Mirage, Maha AND MFJ. Remember these women work for a bowl of rice.
Alex is sending us a BD35 to evaluate and if it's as poorly constructed as you say well...
I've looked at the RF Concepts units and they certainly look well made. By far the best build quality from the far east is the Tokyo HiPower amp's, they make a 100w dual band amp with full duplex capability, but oh boy, do you pay for it!
I roll my own on HF which is where I hang out, 8-pills draws 150A on speech peaks @ 14.6V, I'll let you work it out.
All put together from a kit of parts purchased from that friendly guy down in Myrtle Beach, SC.

(((73)))

Phil G4ZOW/M aint no problem hearing my mobile from the UK.

Congrats on your novice, and soon upgrade.

A suggestion, if you will have only one radio, usually (unless you live way out in the boondocks) a handheld is the most convenient because you can carry it anywhere. I could recommend any brand but Kenwood or ADI.

Andy

I'm curious why you recommend not to buy an ADI handheld. I've been
considering various 2M handhelds but the ADI AT600, with current $30
coupon and free speaker/mic, is within range of what I wanted to spend.

Hello Joe:

A Couple of thoughts. First and foremost, adjusting to college will probably require quite a bit of your attention, at least at first. (Take it from me, I did it a couple of times before I got it right :-{)) Plan on spending the first semsester, at least just getting used to new routine, independance, new responsabilities, etc..

I would sugest holding off on any equipment changes until you know where you're going to be situated and what the school's club station has to offer. It can be tough having to share the station, but with any luck, they have something reasonable that can at least get you on the bands from time to time.

Remember, balance your activities. You have plenty of time to get on the bands on breaks and wehn you graduate. Try to keep your priorities sorted. In the long run, you'll be glad you did.

Best of luck and 73, de Ned N1IRS

3587. Darwin Awards 1997

While having nothing to do with radio, with the possible exception of "Here's Your Sign" playing on the truck, I thought this might be of interest. Don't try this at home.

Mark

As you may already know, THE DARWIN AWARDS are bestowed every year upon (the remains of) that individual, who through single-minded self-sacrifice, has done the most to remove undesirable elements from the human gene pool.

Last year's winner was the fellow who was killed when he attached a JATO (Jet Assisted Take Off) unit to his Chevy Impala and promptly shot himself at 300 mph into the side of a desert cliff. And now, for this year's illustrious winner(s): . . . drum roll . . .

John Pernicky and friend Sal Hawkins, of the great state of Washington, decided to attend a local Metallica concert at the Amphitheater at Gorge, Washington. Having no tickets (but 18 beers among them) they sat in the parking lot, and after finishing the beer, decided that it would be easy enough to hop over the nine-foot high fence and sneak into the show.

The two friends pulled their pickup truck over to the fence and the plan was for John--100 pounds heavier than Sal--to hop over, and then assist his friend over the fence. Unfortunately for John, there was a 30 foot drop on the other side of the fence. Having heaved himself over, he found himself crashing through a tree. His fall was abruptly halted by a large branch which snagged him by his shorts. Dangling from the tree, with one arm broken, John looked down and saw a group of bushes below him. Figuring the bushes would break his fall, John removed his pocket knife and proceeded to cut away his shorts to free himself from the tree. When finally free, John crashed below into Holly bushes. The sharp leaves scratched his entire body and now being without his shorts, he was the unwilling victim of a holly branch penetrating his rectal cavity. To make matters worse, his pocket knife proceeded to fall with him and landed three inches into his left thigh.

Seeing his friend in considerable pain and agony, Sal decided to throw him a rope and pull him to safety. However, weighing about 100 pounds less, he decided the best course of action would be to tie the rope to the pickup truck. This is when things went from bad to worse. In his drunken state, Sal put the truck into the wrong gear, pressed on the gas, and crashed through the fence, landing on and killing his friend. Sal was thrown from the truck, suffered massive internal injuries and

also died at the scene.

Police arrived to find a pickup truck with its driver thrown 100 feet from the vehicle and upon moving the truck, a half naked man, with numerous scratches, a holly stick up his rectum, a knife in his thigh, and a pair of shorts dangling from the tree branches 25 feet in the air.

I will tell you which NOT to buy. I have the Comet SMA 503. It is the thin "rat tail". It is equal or less as effective as the stock antenna. I tried the Diamond products whcih did not work due to the connector on the 50. Also, I recently tried an adapter to utilize a mobile antenna and it also did not connect properly.

Two pieces of advice though. #1) I bought the very small Comet 501 which is 1.75" long. It is very handy in close in situations. Simplex over short distances, Hamfests, "covert" use like when you don't want your XYL to know your radio is in your pocket. #2) When you utilize a second party antenna on the 50 there is a small gap on the connector between the radio and the antenna base. To fill this gap I have purchased cheap colored foam pencil cushions (they ease finger fatigue from pushing a pencil). Just cut off 1/8" or so and it makes a great space. The soft foam conforms great when you screw the antenna down.

Hope my ramblings help. HT KF4SXT

3598. ICOM 751 vs. 737

I have seen a mod for the Icom IC-728/729 radio posted in several places that instructs you to open D8 on the PLL board. Does anyone know the purpose of this mod? Does it correct any known problem?

The only thing I can see that it does is reduce the input voltage to the -8 volt regulator. Is there a problem with too much voltage to this regulator?

The Zener diode went out on mine(shorted) and I didn't have a replacement handy. I replaced the diode and resistor with a 3 legged voltage regulator, works great.

I use this one on my yaesu FT-10r 2 metter version it's A Dual Band
Antenna for hand-helds made by mp Model MFJ-1717 144/440 MHz High Gain
this is a simaller antenna to the diamond products but does not cost as much.
the one I use works great on my ft-10r yaesu radio.

Message-ID: <5svoie$t9b$1@artemis.backbone.ou.edu>
Source record: 168019

I've been using the Scout in my Suburban (previously in my van) both CW and SSB mobile. The noise blanker is very effective, and the variable bandwidth xtal filter is also handy. The radio is very simple to use (three knobs, three switches) and has given no trouble at all. Can't imagine a better setup. It is used with a bugcatcher, so changing bands involves a stop for changing taps on the antenna coil, so changing band modules isn't a problem. I mostly us it on 20 and 40 these days, sometimes 30 and 75/80. No complaints. Good hunting and 73, Jim W5AI.

Bob, All of the major manufacturers current models are very capable units.
I've owned a Kenwood TH78A, TH79A, an Alinco DJ580T, and a Yaesu FT50R.
They are all dual band transcievers. I am currently using the FT50R, it's
loud audio, solid construction and attractive pricing are pluses, it's
lack of an illuminated keypad and poor display visibility are negatives.
My favorite was the TH78A, it is no longer in production though.

Good luck

There is a new contender in the race for superior sound quality on the Internet called Liquid Audio. It provides high quality sound through exclusive Dolby Digital technology.

They are developing professional sound solutions for 'music makers' and have the Liquid MusicPlayer which is like an on-line version of a typical CD and it shows you CD graphics, lyrics and liner notes while you listen to music. You can also purchase and create customized CDs in real-time finally right over the Internet.

They are hosting a giveaway at http://www.liquidaudio.com for CD recordable drives - the equipment you'll need to move your CD from your hard drive to your home or car. While you are there, you can check out sites that are already using Liquid Audio to preview new music and preview singles on the site.

I am building a transmitter, and the schematics/plans that I acquired
say to make an inductor by wrapping enamel wire around a ferrite slug.
I have the wire, but I have been unable to find anything made of
ferrite, let alone something that might make a decent core. Any ideas?

Hardly.

Radio Shack sells NO GMRS equipment that is capable of
hitting repeaters...which is where the GMRS really shines.
The Motorola's do not come with CTCSS, nor can they be
set for proper frequency offset for repeater operations.

Hi,

Does anyone know where I can find a consolidated collection of info on
the computer control of various rigss..? I have the codes for two of
the rigs I own (the Yaesu-736R, and the Icom-702mkII) that are "new"
enuf' that the manufacturers included the info in the manuals, but
pointers to other complete info, especially for Kenwood HF rigs, and for
HTs (not programs that others have written, I'd rather not reverse
engineer them, and, IMHO, its also a rude thing to do) would be helpful
for a set of articles I am working on on how to construct some kool
station controls using a web browser and JAVA.

73,
David

WHAT????!

Why on earth buy a 920 when for only a few hundred more you can get a
870??? Have you TRIED both, or are you just giving us the benefit of
your "wisdom/opinion" based on thinking about the two rigs and reading
the nice little adds in the magazines?

I've tried BOTH radios - buy the 870.

I sat (for hours - over a four day period) and compared both rigs (a
Yaesu 920 and Kenwood TS-870S) side by side at my local ham radio outlet
(they were most gracious and let me experiment to my hearts content) and

the receiver and filtering in the 870 beats the hell out of the 920...hands down.

The filtering in the 920 is in the AF (audio) section (no better than any add-on after market DSP unit), and "rings", making weak stations very difficult (if not impossible) to hear. The 870s' built in filters (in the IF sectioin) actually quiets the background noise, and seems to lift the signal out of the noise to where you can hear it. I could hear stations well enough to work with the 870 (terrible band conditions) - but not so with the 920, it just sat there flashing all its pretty lights at me...

Speaking of flashing lights, the 920 has more of the bells, whistles and flashing lights (sales gimmick) that American hams seem to be pre-occupied with, but the radio itself is just not in the same league with a 870.

"If you can't hear 'em, you can't work 'em!", boys and girls...

If this is a "once in a lifetime" treat for yourself, do yourself a favor, and buy a radio that will satisfy your hamming needs, not just sit there & look pretty...Buy the Kenwood TS-870S.

And no, I don't work for Yaesu, and I don't work for Kenwood - so I have no reason to be biased. I went into the store to compare radios and buy the best one for my money...the TS-870S is a far better radio than the 920 - and the one I took home.

Try Amidon Assc. or RF Parts. Both advertise in QST and/or CQ and 73
Magazine. You might try a web search - I'm pretty sure RF Parts
has a web page. I'm curious about how old the schematic for the
transmitter is? Most modern gear calls for torroidal inductors as
opposed to slugs. Good luck,

Had the same thing happen to me. The BNC isnt at fault it's the plastic
case, that flexes and breaks the connection. I soldered in a heavier ga.
wire in. I used solid #14 but maybe stranded would be better! This has
lasted for me.

<snip>

Not really. All the information you need to investigate this yourself is out there and easily accessable (http://law.house.gov/). Before you launch your next big panic attack, you might check your facts first, then post. Welcome to the *mis*information age.

Now let's take a close look at the proposed bill. If you read it, they are proposing a change to the text in section 302d of Title 47 of the US Code. Here is what it currently says:
-------------47USC302d-----------------------
(d) Cellular telecommunications receivers
(1) Within 180 days after October 28, 1992, the Commission shall prescribe and make effective regulations denying equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that is capable of -
(A) receiving transmissions in the frequencies allocated to the domestic cellular radio telecommunications service,
(B) readily being altered by the user to receive transmissions in such frequencies, or
(C) being equipped with decoders that convert digital cellular transmissions to analog voice audio.

Notice they used the word 'cellular', which we know these days to mean the 800MHZ band. Now let's look at the proposed changes:
------HR2369 version of 47USC302d-------------
`(d) The Commission shall prescribe regulations denying equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that is capable of--
`(1) receiving transmissions in the frequencies allocated to any commercial mobile service (as defined in section 332(d),
`(2) readily being altered to receive transmissions in such frequencies,
`(3) being equipped with decoders that convert digital commercial mobile service transmissions to analog voice audio, or

`(4) being equipped with devices that otherwise decode encrypted
radio transmissions for the purposes of unauthorized interception.'.

Notice that references to the word 'cellular' have been removed and replaced
with 'commercial mobile service'. Of course 'commercial mobile service' is
defined in section 332d of Title 47 of the USC as being a for profit radio
service for the purpose of connecting to landlines. Basically that defines
Cellular and PCS as we know it today, but also whatever wireless phone service
they come up with tomorrow. Here's section 332d so you can read it yourself:
----------47USC332d--------------------------
(d) Definitions
For purposes of this section -
(1) the term ''commercial mobile service'' means any mobile
service (as defined in section 153(n) of this title) that is
provided for profit and makes interconnected service available
(A) to the public or (B) to such classes of eligible users as to
be effectively available to a substantial portion of the public,
as specified by regulation by the Commission;
(2) the term ''interconnected service'' means service that is
interconnected with the public switched network (as such terms
are defined by regulation by the Commission) or service for which
a request for interconnection is pending pursuant to subsection
(c)(1)(B) of this section; and
(3) the term ''private mobile service'' means any mobile
service (as defined in section 153(n) of this title) that is not
a commercial mobile service or the functional equivalent of a
commercial mobile service, as specified by regulation by the
Commission.

So if you or anyone else have read this far, I have one final question and
thought; After reading this, do you still believe this is a dangerous bill?
Well you shouldn't take my word for it. I'm just some guy posting to the
USENET -Check it out for yourself!

Initially I was also going to buy a ft50, but I wanted the dual band receive. I've had the 79 for about six months. The online manual is worthless after you figure out how the radio works, and it doesn't take long. I guess the only thing I dislike is the way Kenwood made the headphone plug; standard head phones wont fit.
I think that the radio is good for me, but since I've never used a ft50 I can say that the 79 is better. And they do look sharp, don't they?

3641. Best antenna for the Yaesu FT-50RD

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-14 00:00:00 UTC
From: tvsjr@sprynet.com

I just purchased a new Yaesu FT-50RD. So far, I am quite pleased with it (for the 24 hrs. I've used it), but I have been told that the antenna is 5db below unity (hmm...). Could you please suggest the best antenna out there. I would like to use it for general-coverage recieve, including air-band and 800mHz conventional. I would prefer something shorter than 10 inches, because I will be carrying it on my belt regularly.

As I don't regularly read the newsgroups, please e-mail your suggestions to TVSJR@SPRYNET.COM

Few tenths of a mile....what's between you, block wall, metal wall or open? Makes a big difference.

GMRS (General Mobile Radio Service) is a licensed service - you can buy radios that run 2 watts at radio shack, and send in the license app. with $$, that's all there is to it.

FRS (Family Radio Service) also available at Rad Shack, runs .5 watt on UHF (probably enough for you), about $100 each and no license required. No base stations available due to power limitation.

For GMRS, Motorola makes several bases... like a GM300, runs abt $300, but way more power than you need.

You picked the appropriate newsgroup...

I suggest you get a couple of FRS rigs and try them out - make sure you can return them it they don't work for you, and then try the GMRS ones.

Several Mfgs. are making FRS rigs that are better that the rad shack...like Yaesu (Vertex), and several others I can't think of now. Check with Ham Radio Outlet.

One more thing, I am not sure if using FRS for this application is completely legal....any comments from the group??
Good Luck
Ernie

3650. Radio Model Guide

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-14 00:00:00 UTC
From: wpeloqui@ismi.net
Message-ID: <33f34cd5.89453108@news.execpc.com>
Source record: 168078

I am currently in the market for a used HF radio and I realized that I don't have a clue to most of the model numbers. It seems to me that a Radio Model Number Guide would be a great web resource.

I am willing to host this RMNG web page, all I need are descriptions of the radios! So I guess that I am asking for Descriptions, pictures specifications etc of your radios so I can build it. I myself know what a Kenwood TH-75A is and a TH-211 (i think). Hell I don't even know what the model of my Mobile rig is!

If there is any interest I will put together this page and put it online.

Thanks,

Willie N8MDY

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectrom SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

Howdy. I have a Hy-Gain EX-14 10-40M yagi that was up for a good while, then taken down and disassembled before being sold to me. I am in the process of polishing each section of element and the traps by hand, and resetting the dimensions to operate on the band portions I want (it was set to the Advanced/Extra portions on some bands, and I am soon-to-be a General or Advanced, but would like the antenna to resonate where I want (being the new owner, you know...). Only problem is that some of the elements seem to be cemented together at the swaged joints by what looks like either corrosion or some white paste. There are many joints that I am afraid to force, and I don't want to cut any element section take was designed to telescope. Any help / tricks / secrets here from the experts? I don't want to damage the yagi, as i intend to put a good 10 or 20 more years of DX on it.

I don't believe any such model was ever built....the only 101s were
the FT101, FT101B, FT101E, FT101EE, FT101EX and FT101ZD. All but the
FT101ZD were almost identical with a few details changed with advancing
models. The FT101ZD was quite different and used different final tubes
(6146's) You're probably getting either a FT101EX or a FT101ZD. The ZD
would by my choice. 73, Dick

Source record: 168094

The SB220 and SB221 are essentially identical except that the 221 does not have the 10 Meter band-it was introduced when the FCC banned the production and sale of amateur amps that included 10 meters in a futile effort to reduce their use on CB. The SB230 uses an external anode conduction cooled and very exepnsive tube, the 8873 (one tube).

Jeff:

It's a really good dual between the 1000MP and the 870. I've never used a 1000MP, but they do have that separate receiver to monitor two frequencies at once, the 870 doesn't. People who have used both comment that the 1000MP is better at digging out weak signals in the presence of strong signals near by (complaints of front end overload).

I own an 870 and can make the following points to own one:

1. Great CW rig...Nice built-in keyer

2. Digital band-pass filters are excellent

3. Audio quality of this radio is second to none.

As far as 'justifying' the cost? There really isn't any, unless you have the money (and desire), or are a hard core operator, or both. I'd say a used 850 at half the price is a much better deal as far as units of fun per dollar.

But if you DO have the money, and you love radio (as most of us do) it is well worth the extra money...especially when you consider you'll probably be using that radio for the next 5 - 20 years.

If you have specific questions regarding the 870, I'd be glad to help. Good luck with your ultimate choice...you can't go wrong with any of the radios in the class.

You might check to ensure that it is not in DTMF remote (remote control via another radio). I had the same problem with the V-7's predasessor, the TM-733. I now have a TMV-7 and do not have it in DTMF remote as I did the 733. Several people have told me the same story. Since I no longer leave the radio in remote, I have not had the problem.

>I'm looking to make a 2 meter J-pole antenna. Anyone have instructions?

Here are the instructions for the Better J-Pole.
Remember, the spacing is important, If you use any material
other than what is shown here, you may have to change the spacing
to get a low SWR.
Please e-mail me, and let me know how this works out.
and let me know if you have any questions.
You may want to print the page showing the J-Poles at....
<A HREF="http://members.aol.com/Arrow146/index.html">Arrow Antenna</A>
or
http://Members.aol.com/Arrow146/index.html

Construction Plans for the Model J146 2 Meter Solid Aluminum J-Pole

Parts Needed:

Radio Shack # 21-961 3/8"-24/SO239 Mount (Mobile CB Antenna)
Radio Shack # 15-826 TV Mast U-Bolt Clamp Assembly
About 80 inches of 3/8" diameter Solid Aluminum Rod.
5 1/2 inch piece of strut angle Aluminum 1 1/2" X 1 1/2" X 3/16" Thick.
2 Stainless Jam Nuts 3/8-24 thread

Tools needed:

Drill Press with drill Bits up to 1/2".
Tap & Die for 3/8-24 thread.
Sander or file to de-burr the cut edges.
2 9/16 wrenches & a 3/4 wrench.
Vice-grips

Make sure the piece of angle Aluminum is exactly 5 1/2 inches long.
Drill 2 1/4" holes on one side, centered to fit the U-Bolt for mounting.
On the other surface of the angle
Measure in 1/2" in from each end and drill a 1/4" pilot hole.
This should give you 4 1/2" from center to center of the two holes.
Redrill one of the pilot holes to 11/32" Then tap the hole with a 3/8-24
Tap.
Redrill the other pilot hole to 1/2"
Finish as required.

Cut a piece of the 3/8" Aluminum rod to about 59".
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 8 threads in the other end.
Screw on the Coupling Nut that came with the SO239 Mount
Tighten as much as you can.

Measure the rod & coupling nut & cut to exactly 57 1/2"

Cut a piece of the 3/8" Aluminum rod to about 21"
Attach a vice-grip to one end.
Using a 3/8-24 Die cut in about 14 threads in the other end.
(If you don"t have jam nuts, cut enough threads for 2 nuts & the thickness
of the angle bracket.)
Screw on one of the Jam nuts & tighten as much as you can.
Measure from the bottom of the nut and cut the rod to exactly 19 1/4"
(Remember the nut must be included in the Measurement.)
(Put a small amount of grease on the threads)
Screw the element into the threaded hole of the angle bracket and tighten.
Screw on the other nut and tighten it.
Attach the 57 1/2" element in the 1/2" hole using the rest of the SO239
Mount.
Mount & test your new antenna. SWR should be < 1.2-1 at 146 MHz and
<1.4-1 at 144 &148 MHz.

This Model J146 is available from Arrow Antenna for only $ 35.
The J146/440 Dual Band with single SO239 feed is only $ 43.
Please add $ 6. Shipping & Handling per order (for US Funds).

3676. Forcing FT-8000 into AM mode??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-15 00:00:00 UTC
From: KF6BBL@qualcomm.com
Message-ID: <5t0i4d$3qk$1@thefuture.qualcomm.com>
Source record: 167905

Does anyone know how to override the default receiving mode of FM and receive
in AM on the Yaesu FT-8000? It's smart enought to switch to AM when in the 110
to 130MHz range, but not for the Military aircraft band.
It seems that the Blue Angels are in town this weekend and they use alot of
250-300MHz AM, and it would be fun to listen in.
Thanks,
-BP

Art,

I do not know if this is an attenuator or not, and the manual is not
clear at all. It uses essentially the same words to describe the
"normal" suqlch and the RF squelch. The only real differentiation is
that the RF squelch is tied to the S meter reading. It doesn;t say
what the normal squelch is tied to. If anyone has further info on
this, please post. I'd be interested, too.

Looking for an assortment of millimeter wave guide pieces and assemblies. Assemblies such as mixers, coupler,isolators, horn antennas, gunn oscillators etc.Wave guide sections especially with flanges. Parts should be for 40 to 140 GHz. We are talking real small here. The largest size of interest is WR 22. Anything over 1/4 " for the long side is too big.

I can pay some modest prices for some of these parts but nothing near commercial prices. If you might have some in a junk box, probably from some military surplus, I would appricate your taking a look and letting me know what you find.

>
> We need to communicate between an office and one person in
> a warehouse environment (max a few tenths of a mile maybe)
>
> Is a business band radio the way to go? VHF/UHF?

Yep....VHF or UHF intenirant (sp) channels would be ok...

>
> Is it hard to obtain a license?

No...for the above named channels, you merely fill out a FCC form
and mail it in with check for fee...BUT you accept any and all
interference on those channels (sometimes called "red dot" or "yellow
dot" etc...) If you want a cleaner channel, you have to pay more for
coordination, etc...

> Does anybody make a base station?
> (cost comperable to the hand helds or less..)

Just use a HT on a power supply (plenty of HTs run off 12V)...and if
you need a base antenna, you can easily put a simple groundplane up.
I dont recall what the rules are on the Intinerrant channels (hey I
spelled it right!) currently regarding base station operation...

>
> Did I pick an apropriate newsgroup?

Close...there is NO two way radio NG currently...There is a fake
rec.radio.commercial-lmr but it was NOT formed properly and MOST ISPs
donot carry it because it does not meet Internet requirements..

Get a copy of Part 90 and check the Int.channels...VHF or UHF with 2-5w
Hts should cover what you want...VHF is better for long distance...UHF
is better for in buildings, etc....but worse in trees...especially
PINE trees..Check with local two way radio shops for what they have on
the Intinerrant channels and the current rules in Part 90 of the FCC
rules

Doug,
I asked essentially the same question to a newsgroup two years ago. I
received the following replies. I never had the chance to try any of
the suggestions, unfortunately.

===== Begin quotations =====

Have you tried "Alumtap" made by Winfield Brooks Co. Inc? I don't know
if it
will work but it shouldn't hurt to try...

--
Gene Battin, N9XAM

=====

Something else, you might try is common easy-off oven cleaner. It is
common
sodium hydroxide, lye. Be cautioned, that the chemical is extremely
caustic.
It will "eat" aluminum, so use it sparingly, and flush with water often.
Another chemical on the market, probably safer to use is "aluminum navel
jelly", made by duro, the owner of loctite. Another cleaner is "mag
wheel

cleaner", available in auto supply stores. It contains phosphoric acid.
Again, use it with caution. Flush with water often.

There are tapping compounds for threading aluminum, such as "tapmatic",
available in tool shops and your better hardware stores. I don't
think it will help in taking the equipment appart though.

Hope this helps -
jrh

Please tell me where can I find a very good document about Phase Locked
Loop (theory and/or practical).

I wonder if its possible building an PLL oscilator module for short wave
amateur bands with... lets say... 100 Hz step. (3.5 up to 28 Mhz)
In this case, old 381/382 can be used??

Please email me your opinions and/or point me to www servers.

TIA!

From: sweeper44@aol.com
Message-ID: <19970815115601.HAA27475@ladder01.news.aol.com>
Source record: 167916

Thinking of getting the ft 920 any pro's or con to this radio. And if there cons the radio of there choice...

The 920 seems to fit the bill. And the bill is $1,800.00 But not bad for a all mode 160-6m 100w.....

So any ideas on this radio all are welcome.

Jim

3688. Li-Ion vs Nicad vs NiMH

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-15 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.259.004F5DBE@facstaff.wisc.edu>
Source record: 167917

I understand that NiMH has increased energy density, but shorter shelf-life between charges and requires a minimum charging current. I am also told that NiMH does not tolerate extended charge (ooops I forgot to take out the batteries last night....) compared to NiCd

But does anyone know how Li-Ion cells fit into this matrix?

Thanks,

Fred K, N9SLR

>> In a heavy RF environment with strong signals close in to the one

>But, with all respect to your post Clark, have mention trying the radios
>side by side...have YOU done this? Have YOU experienced any problems

Yes I have. Took several hours to work them side by side. This was
before the QST review, but, no, I didn't have the 160 meter contest
to try it out on, hi hi.

>with the receive in the 870? Do you even own a 870, as qualification
>for the comments you made about it?

No, I don't own one.

You make a good point, and I heartily agree with you in the main.
The ONLY way to really judge a radio is by using it under the contitions
you anticipate will be typical for you. On that basis, the QST review
may not mean anything to a given individual. But then, that
caveat works for anyone else's review too.

Wish we lived closer, I would bring over my OMNI VI and we could
set them up for the 160 meter CW contest and experience the
differences to our hearts content! Hi hi.

Yes, BUT it does have an attachable wrist cord and you can attach the
can opener to this. Works great as you can open your bottle and still
have the antenna straight up so you can hit the repeater without any
problems.

Neat little radio!

Am gonna have to pull this beast apart and kick it a few times. Am wondering if tinning some of the coil parts at the "most frequently used" windings will help. Its become very intmt after a years use. Read somewhere that contact cleaner would take care of it where the roller engages the coil as it slides along. I doubt that very much. Thought I saw on some group before I bought this that they had to replace the slider with one made of lucite or something of that nature to insure dependable contact. Any suggestions would be appreciated

Roger-

Look at the Kenwood TM-942 Tri-Band radio. It comes with Two Meters, 440 MHz and 1200 MHz. I purchased one a few months ago, and was able to work through a 1200 MHz repeater, while still in the parking lot of the radio store!

Unfortunately, I don't live near the radio store. As far as I can tell, the only 1200 MHz repeater in Mid-Florida, is in the center of the state, and rarely accessible from the coastal area where I live. (I have yet to hear any activity on the National Simplex frequency.)

Before you take the leap, look at a Repeater Directory to see if there is any repeater activity on higher bands anywhere near you. If there isn't, there may be some simplex activity, but don't depend on it.

There is a modification for the microphone on the Kenwood ftp site.

ftp://ftp.kenwood.net

Look in the Application Notes directory. You can also turn off the
microphone control OFF. Of course the direct entry will not work. You
can send the mic in to Kenwood to have the mod done under warranty.

>
>Don (KE4KYO)

Normal FM squelch is a *noise* squelch. It measures the degree of quieting on the channel and opens when the set point value is reached. The "RF" squelch is just a signal strength squelch such as you might find on a CB or on a HF SSB rig. It opens when signal level exceeds a set point threshold.

Most FM noise squelch circuits measure quieting by looking at the ratio of noise at high AF, IE above the modulation bandwidth, to noise at low AF, IE in the modulation bandwidth, out of the discriminator. This is generally a more desirable form of squelch because it is insensitive to amplitude variations of the signal, but it can be fooled by certain types of wideband crud.

"RF" squelch derives its signal strength indication from limiter current. Stronger signals will increase limiter current. This sort of squelch can be fooled by crud too, since limiter current is proportional to the sum of *all* signals in the passband, but this is different behavior than a noise squelch. In a particular situation, one method may work better than the other.

The radio is responding to DTMF codes through the mike.
This is a bizar feature that allows my DTMF like sounds like my
girlfriends voice to control the freaking radio.

Kenwood has a fix for this. You can send your mike back and they will
fix the mike. Of course you wont have the mike for a few weeks...

In my opinion Kenwood should swap the mike. This stupid to allow the radio
to do this and and require you to have it fixed.

i am looking for any 6 meter dipole plans for 6 meters.i would like to
build it out off 3/4 copper.any ideas thanks 73 jack n9iif

2808 divided by Frequency (52 MHz.) = 54" (1/4 wave) tuning stub.
54" times 3 = 162" or 13.5 Feet (3/4 wave) for the long element.

Still want a J-Pole for 6 meters ?

If you really want to build this monster,
e-mail me, MAYBE I can help.

Hi to All:

I have a Hallicraters mode SX-71 receiver. I need some tips on the repair of the Band Switch. The rear most wafer is worn out. I have a Hallicrafter part number from Sams Photofacts but no second source is listed.

Any ideas?

Also is there a web site that deals with collector grade receivers?

Thanks for any help.

Best regards

Greg

3717. FS: ICOM 211 all mode and/or RM2

3718. VX-1 vs. C508A: Gains & Losses

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-15 00:00:00 UTC
From: andy@vais.net
Message-ID: <871647377.22300@dejanews.com>
Source record: 167956

If you enjoy playing with miniature dual-band HTs, and are wondering whether to switch from the Standard C508A to the Yaesu VX-1, here's a summary of my perceptions of the gains and losses incurred by making that switch. Your own perceptions of gains and losses may vary, depending on your personal needs and preferences, thus making it quite unnecessary to flame me if you disagree ;-) Also, I have not taken into account Standard's new mini-dual bander with touch-tone pad; I am simply comparing the two "smallest" units. Therefore, this post is aimed primarily at C508A owners who are considering an even smaller HT. 73, Andy - K4ADL

GAINS (things I like about the VX-1 over the C508A):
---

01. Alpha-numeric memory display.
02. Bit more compact and stealthy for use during staff meetings.
03. DC input capability, thus doubling power. (DC cable = appx. $40)
04. Ability to charge, receive, AND TRANSMIT using AC power cube.
05. Option for ADMS programming (coming in October?)
06. Automatic repeater shift (I always liked this feature).
07. More memories. (I forgot how many).
08. Autopatch capability (via pre-programming or clunky manual method)
09. 220 MHz ham band receive (if you're within couple of miles of rpt)
10. Ability to receive public service stations around 490+ MHz.
11. Rcvs all FM stations, + TV Ch 5-13 + all UHF stns. (GOOD audio!)
12. ARTS system with CW ID, too.
13. Accessories more readily available at Ham dealers.
14. AM broadcast reception (with appropriate antenna).
15. MARS/CAP mod much easier (so they say).

LOSSES (things I miss about the C508A):
---

01. 800 MHz pub svc band reception is horrible, unless you're very close to transmitter. Can't monitor our county police anymore ;-(

02. Gave up convenience of "scanner-type" operation. Must activate different bands to monitor various frequencies. I preferred Standard's ability to assign various frequencies consecutively within it's one main bank. This really annoys me.

03. Dial knob options do not include memory tuning, just VFO or volume/squelch. I preferred Standard's setup, especially with the dedicated volume control knob on the side.

04. Lost 30 and 50 KHz step tuning (but gained 100 KHz steps).

>to purchase ANY filters to make the TS870 perform better.
>I bought my TS870 from Ham Radio Outlet for $2219.00.

With due respect for the 870, it is a really good radio....
In a heavy RF environment with strong signals close in to the one
you want to dig out, the 1000MP with some crystal filters will
probably be superior to the 870. See the QST review of the 870,
they hinted at such a limitation of the almost totally DSP IF
chain, since the only filtering before the DSP is about 3.0
kHz wide, really strong signals in that passband can overwhelm
the DSP. Try the rigs side by side in the winter 160 meter CW
contest with a good antenna, and you'll see the difference.

However, if you intend mostly SSB operation, and you are not
going to attempt the nastiest QRM environment, the 870 is really
great. The audio output is wonderful, many great features, etc.

Good luck.

You may want to try a noice canceller, tho it may not be effective for your needs (may take a larger noise sensing antenna than you can put in a mobile!).

The JPS ANC-4 is one such device. MFJ also advertizes one. See Feb 96 for review/discussion of ANC-4.

DSP will work to narrow your bandwidth. But, for SSB, you can only take that so far (e.g., 1.6 KHz) and still get readable voice.

Phil

HERE WE GO....!!!!This is a vent on the subject of "reviews" - not a
flame towards Clark personally...

But, with all respect to your post Clark, have mention trying the radios
side by side...have YOU done this? Have YOU experienced any problems
with the receive in the 870? Do you even own a 870, as qualification
for the comments you made about it?

If so, I would sure love to hear about your experiences, because no one
(in my experience, that I know of) has ever actually EXPERIENCED the
"overload problem" that QST mentioned in their (foot in mouth) review of
the rig...:)

BUT, everyone sure seems to mention "the problem" whenever the radio is
discussed...LOL...

Not meaning you personally Clark, but almost without exception, the
people who bring up the QST "problem" are people who have read the
review, never actually used the radio, and don't (parden my french) know
what the hell they're talking about. They're simply armchair reviewers,
repeating what they've read somewhere, without any first hand knowledge.

People, if you WANT information on a rig, ask for information from
people who OWN or have USED the rig for an extended period, to give you
THEIR impressions...and find out how the radio performs in actual on the

air experience - not sitting on a bench, in a testing lab.

And "armchair reviewers" (not you Clark) - If you haven't actually USED a rig yourself, and don't know what the hell you're talking about, save us your "expert reveiw" of it, ok?

Next time someone gives you their "expert" opinion on a rig, ask them if they've actually used or owned the rig... :) and watch them get all defensive... it's a hoot.

Vent done - feel better.

Well Gang,

I just received the new Radio Shack catalog and guess what. They are out of the GMRS radio business. They are heavy in FRS but no GMRS. I guess sales were not what they expected. However, if they had provided a radio with more features maybe their sales would have been better. I don't get it. Their ham radios, cb's and even the marine radios all have options like scanning, "privacy codes" and even weather channels built in , but I haven't seen one GMRS with these features. It seems Maxon is the only game left in town and their's is not a Cadillac. If anyone knows of a another alternative please let me know. Mean while lets all send Radio Shack an E-mail or two.

DSP can also be used for denoising a signal (couple of different techniques, implemented by JPS and Timewave respectively). These methods can make a SSB channel more pleasant to monitor, but they won't literally let you pull SSB signals out from under the audible noise floor. To do that, you need a signal with more predictable characteristics for the correlator to get its teeth into than analog voice provides. But they can turn difficult copy into more pleasant copy, and that's often worthwhile.

Speaking of which, the only thing I've found about the VX-1 that I don't like is the belt clip. It's plastic and doesn't grip very well, which has nearly resulted in the radio going flying several times. Also, the clip screws into a threaded brass ring which is only press-fit into the back of the radio. The first time I got into the passenger side of a car with the radio on my belt, it brushed against the seat and pulled the brass fitting half way out of the radio. After tapping it back in a few times, I've now epoxied the sucker in place and it's not going anywhere.

Hi Jeff:

There are some Ten Tec fanatics, but there are many moderates,
I count myself among them. I really like the Japanese rigs a
whole lot, sometimes I prefer them. Overall, though, I have chosen
to go with the OMNI VI at present, it serves my needs well and
I get bragging rights about having a rig made in the USA, hi hi.

The ONE large advantage to the OMNI VI over all the others, in my
experience, is weak signal copy while in the presence of
nearby heavy QRM. This is evident for CW signals, where I like
to do a lot of my work.

There are lots of little items to make comparisons, but most are
only applicable to individual situations. Like I said, I respect
other rigs, just gave up my old Kenwood 440 that would hear
95 per cent of everything the OMNI VI could, maybe more. There
were few situations where the 440 could not dig out a signal
where the OMNI could, but I did find those situations at times
here at my QTH with my antennas. I was offered an even swap for
a Yaesu FT 1000 with all the filters, and after a week, it was
hard to choose, the Yaesu is a first rate rig, possibly the only
one I would swap for. I did stay with the Ten Tec, partly because
I understand the radio and trust the service dept there (but I
understand Yaesu is pretty good in this regard, too.)

If you can, TRY these radios out for yourself. Really. I can't
emphasize that enough. Like the previous poster explains, the
armchair engineering opinions (OK, I'm guilty) are a dime a
dozen and may not apply at all to your situation, or may just
be partisan nonsense. Put one in your hands and dig in. Good
luck.

Don't worry about repeater capabilitys. If your that close you won't need one. I live in a good sized city and can get up to 5 miles on a 2 watt GMRS handie talkie. (talkie to talkie) 3 miles being more typical in my situation.

I also have a 35 watt base and 6 db gain antenna at the house, along with a 35 watt mobile. This combo will cover nearly 15 miles. My base antenna is at 40 feet. (height being the critical factor in any UHF system!)

The licensing is a little more involved for a high power base, but it is well worth the extra trouble.
(50W max radio output, no erp limitations, 200 ft max ant height. You do have to specify your antenna height and calculate your erp when applying for your license)

I wouldn't mess with the FRS stuff, go for the GMRS. It is a lot more flexible in the long run. Note that GMRS can talk to FRS stations on the 462...Mhz interstitial channels. you can run up to 5 watts on the GMRS interstitials, whereas you are severly limited to 1/2 watt for FRS.

If you require more info I will be glad to help.

Take care!

It should have extended receive out of the box, but
mine doesn't, only covering 144-148 MHz.

Am I missing something here?

The ads spec it to receive from 138-174 out of the
box.

Help! Thanks!

3739. Yaesu FT-3000M 800mhz mod info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-15 00:00:00 UTC
From: zaax@aol.com
Message-ID: <19970815143200.KAA04476@ladder01.news.aol.com>
Source record: 167977

I have been looking for a mod to enable 800mhz reception over the
forbidden band with my Yaesu FT-300M. This is is the interesting reply
that I got from one ham

73
Zack Schindler
N8FNR

Zaax..
Good morning first.
I am happy, for your reply,I didn't thought it was going to be so
soon.
Do you use Powwow?
I didn't understood very well your question: How do you like the
rig so far?
But I think the answer is yes I like it very much, it have a very
diferent design, a lot of usefull functions (despiste some very useless
functions like the dual watch), it is small, and powerfull, and have a
very
wide frequencies range (my own go from 110.995 to 180.995, 300.995 to
520.995 and 800.995 to 999.995).
From what the ham told you DON'T believe him, it CAN be done I am
completly sure about this. I will explain:
Some time after I bought my Ft-3000 the salesman who sell the
radio for me
came and told me that he knew a japanese man who knew how to unblock the
cellular band for me (the act of listening frequencies is not ilegal here
in Brasil, you can listen to everything because no one is owner of a freq,
but of course you can't say it to anyone, interfere with the comunication
or use it in any way, you must keep it for you only, so you can't
prejudice anyone) but the man would charge the service about US$45,
because
I already had paid the almost same amount to this salesman to modify my
radio (MARS/CAP only, not cellular) I few that I was deceived, because
what
I paid would include the cellular unblocking, and so I didn't paid him,
and
I made the promise I would find it on the Internet. After a long time (I
have my Ft-3000 since it's earliest days) trying to find out the
son-of-marvelous-mother modification, I contacted the salesman again and
asked him if he know anything about the mod, what he told me, if it is
true, is very interesting: the unblocking mod is not a fisical mod, but a
software hack; to unlock the cellular band you must enter a number
sequence
on the mic's keypad, you don't need to open the radio, just enter the

apropriate code on the mic; the salesman told me another thing, that he was
not very sure but maybe I said maybe, the code you enter on the keypad is not the same for all FT-3000 radios, because part of the code must have the
serial number, or part of it in the sequence, but that is not bad, the real bad news is that (he is not sure about this too) you must have the ADMS software for the FT-3000 to make the hack, for me this is no bad cause
I bought it with the radio, and personaly I encourage you to buy it, because it makes the use of the radio a LOT more easy. Another fact that make me sure that it is possible to unblock the cellular band is the fact that I sent an e-mail to Yaesu and they told me that they was not authorized to give me this and MARS/CAP mods. And if it was not enought I was able to enter any cellular frequencies in the radio memory using the ADMS even those frequencies withing block range!!!But again I was not able to freely tune up or down.
I even ofered to the japanese man a considerable amout of money if he tell me the hack, but he didn't told me and I think he is not going too. Another
thing I know is that this information is only avaible in Japanese technical
literature.
My friend, THESE HACK CODE BECOME A VERY PERSONAL MATTER FOR ME, I WANT TO KNOW IT, HOW TO DO IT, HOW IT FUNCTIONS, AND LAST BUT NOT LEAST I WANT TO BE THE ONE WHO IS GOING TO MAKE IT ON MY RADIO. I am sure you can undestand me. Every information leaks, it is just a time matter, like Einstein said on Red Alert, ''TIME WILL TELL, SOONER OR LATER, TIME WILL TELL''
These is it, let's pray for some luck and wait that these soner or later
be soon and not late.
Good luck.
Felipe Castanho

I had the same problem with my V-7A when remote DTMF was enabled -- loud music from the car stereo would cause all sorts of strange things to happen. It's a shame, because the TT buttons on the mic can be used for lots of useful functions, but it wasn't worth the hassle.

A simple cure would be to rewire the mic so that the mic element was only enabled when PTT was pressed, but I haven't had the time or energy to explore whether that's feasible.

I used the contact cleaner method. Every few months, I take it out of the case and use DeOxit (that is a very good brand to use) and some paper towels and spray down the roller, roll it against the towels and watch the dirt and metal flake oxides roll off of it. I do that till it comes clean, leave just a thin film of contact cleaner, mostly wiped off, and reassemble. I didn't have many problems this way, but I did have to do the regular maintenance.

I suspect the newer air core roller ($59 from MFJ) would do much better, it is really a nice coil. It will fit with two easily drilled holes just a bit out of the standard holes, then mounts right up to the front turns counter and stuff.

Good luck.

Except for the 140 all the above are ham band only. The 520's are the workhorse and there are a lot of them around. Some of the 820 were "S" models with digital display. The 530/830 are some of the better receivers Kenwood ever made. The 180 has a very touchy protection circuit but works well with provision for cascaded IF filters and has digital display.

I didn't dig up the exact introduction dates on the radios but can if you need it.

You might also consider the 120/130 series. All solid state 100w 80-10m ham band only but very rugged. Difference is the 130 has the WARC bands. Both have digital display.

I haven't had much problems using any of the 6JS6C's in the Yeasu FT-101's. You do have to modify the neutralization circuitry to work with most of them. The existing neutralization capacity is insufficient. Actually, I believe the first Japanese tubes used in the FT-101's were Toshiba's. These NEC's may have a better match to the existing circuit and may avoid the modification, but that's about it.

--<snip>--

Problem is ... Kenwood has discontinued the TM942A ... you can still build one, starting with a TM742AD (144/440) or TM642AD (144/220) and adding the UT-1200 deck to it for 1.2 gHz, however ... and the end cost is about the same, with the end result being exactly the same, except you get to choose the "middle band" at either 220 (starting with the TM642AD) or 440 (with the TM742AD).

I'm sorry... I said cap and meant diode (school does that to ya!). The
yellow mod screws up AM aircraft and the diode doesn't.
Also, ftp.qrz.com/mods has 6 files on the 706 and MkII, one of which
is the diode.

Uh-huh. With misinformation spread about by well-financed lobby
groups, one of which represents Qualcomm. Now isn't that special?

>So if you or anyone else have read this far, I have one final question and
>thought; After reading this, do you still believe this is a dangerous bill?
>Well you shouldn't take my word for it. I'm just some guy posting to the
>USENET -Check it out for yourself!

Not as dangerous as HR 2369, which is much clearer in its intent to
modify Section 705 of the Communications Act to outlaw "interception
or" divulgence of radio communications. HR 2369 is also written by
Congressmen who were purchased several reelections ago by the cellular
industry, of which Qualcomm is a part. "Just some guy" indeed. Now
who's putting out "misinformation"?

I have a TS870 and I think the very same as WX3B. It is a remarkable
radio. It was my first NEW rig (all other rigs I've owned in 20 years
as a ham have been used) just like you are thinking of " a once in a
lifetime purchase" the TS870 is mine and I love it.

>>The Yaesu FT-1000MP is a similar price, is it as good / better?
Not so. The FT-1000MP is almost $500.00 more and you will never have
to purchase ANY filters to make the TS870 perform better.
I bought my TS870 from Ham Radio Outlet for $2219.00.

Hope this helps.

3773. Kenwood V7A Bugs

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-16 00:00:00 UTC
From: Otto De La Torre <ottod@ibm.net>
Message-ID: <33F5F029.474F60E0@ibm.net>
Source record: 167856
Body handling: HTML body converted to readable text

I got a TM-V7A, overall is a good radio, nice features good ergonomics, between other features I like internal duplexer automatic tone detection and a band activity scanner.

However things are not perfect I have found two or three minor bugs:

CTCSS Stop Working Properly When Use DTMF Memory

When TM-V7A is tuned on repeaters with CTCSS decoder on, after using the DTMF memory for auto patch purposes (just after sending the DTMF digits), the CTCSS decoder stops working, and the audio mutes, in order to proceed with the communication the CTCSS has to be turned off..

Turning the power off/on forces the CTCSS decoder to work again, but if the DTMF memory is used again the problem re-appear. I is very interesting that the only affected portion of the band is the 440 MHz. this problem does not happen at 144 MHz. band.

Kenwood has informed this problem to their Japan engineers for further evaluation. It seems like at this time all TM-V7A have same problem. So far they have not come with an answer.

Poor Selectivity

When the radio is tuned on VHF on a particular frequency and the squelch is open for some time the radio experiences random signal fading due to near channel activity.

I realized about this when I had my handheld 79A tuned on same frequency (weather 162.550 MHz) the V7A signal strength meter dropped to "0" and audio went muted (total fading), but on the handheld (even with the little rubber antenna) I had consistent signal.

Later on I repeat the test on high activity VHF repeaters and I experienced the same problem I have not been able to verify this on UHF. I checked the antenna and coax line, even I plugging my TM-732 and the symptom does not appear.

I reference to this problem, after some testing Kenwood found nothing, they send me loaner radio for testing and I found same problem, so I went further and I found the the adjacent channels interference rejection was not as good as the TM-732A or their handheld 79A . I just think that the TM-V7A selectivity is not as good as its ancestors.

If you would like to add your comments to this message your comments are welcome.

>abuse@localhost

I use an FT-50RD also (sn 18) and the resistor mod allows for complete
general coverage recieve, 76-540 and 590-999. I have performed both
the solder mod for extended TX and the resistor mod. The resistor mod
puts it in a debug mode with certain keys which allow you to change
power outs (you can trick one up to 8 or 9 watts), change hysteresis
levels, s-meter values, etc., along with the band plan.
1. Remove R1 above solder pad 1
2. Set VFO A to 144.0 and VFO B to 443.0
3. Turn radio off
4. Hold down know, ptt, and lamp.
5. The first menu should be band, works just like any other menu.
Press button and rotate until it says free.
6. Until you know what they are and have proper test equipment to
calibrate them, I would not mess with other settings.
7. Cycle power.
8. You are done!

Also, if you get to adjusting the other settings, there is one for VHF
and one for UHF. Just put 443.0 in VFO A and put it into debug mode. A
u will appear beside the settings, meaning UHF.

I hope it helps!

Take a look inside a junk TV set. You will find a fistful of slugs
and ferrite cores.

Hello,

I have the following items for Sale.

Please make an offer on any or all.

Motorola MT1000 VHF-Hi band 16 Ch. with charger and battery, I have 2 of them

Motorola Radius P100 VHF-Hi band 2 channel includes battery, but no charger

Kenwood TM-721A 2m/440 Mobile radio 45watts-2m & 35watts-440. case has some scratches, but works GREAT !!

make me an offer, note buyer pays shipping, and all shipped COD for both of our protection.

3787. IC-706 to AH-1 interface diagram

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-16 00:00:00 UTC
From: ak2f@qsl.net
Message-ID: <871781988.140@dejanews.com>
Source record: 167870
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Recently, I've seen some Icom AH-1 mobile antenna tuners at local hamfests. Since this seemed to be a cost effective way to use the IC-706 on 5 bands without getting out of the vehicle (bought mine for $40), using a standard whip antenna, I took the time to figure out how to interface it. Thought this might be of interest to others, so below is a cable diagram:

AH-1 IC-706
Pin # Name Wire Pin # Name Notes
1 Ground red 2 Ground
2 13.8 V gray 8 13.8 V when on 1A max
3 Band Ref Volt brown 1 Regulated 8 V
4 Band Switch Sig green 5 Band Voltage 0 to 8 V
5 T/R Switch orange 3 - Send < 20 mA
6 Ext 13.8 V + To DC Power Include in cable
7 Ext 13.8 V - To DC Power and bring to front
8 NC for power hookup

Notes:
Color and pin # refer to the accessory connector supplied with the IC-706. The 4 pin molex connector located next to the power connector may contain some of these signals also, since it is used with the AH-3 tuner.

Using an 8' wire to simulate a whip, the combination was working ok in my shack. Hope to hook the set-up in the car tomorrow.

73s,
Woody - AK2F

> MAHA. You might want to check them for a better replacement.

The better solution to this is simple: For a pager size radio, get aclip
meant to go onto a pager... In the case of the VX-1, I recomend a clip
used on the NEC PR150's or possibly an old Shinwa(cant think of the
model number) You can often find these at Ham fleas for a couple of
bucks. They are made out of METAL, they have a hook along the lower
edge, so forget about it sliding off your belt. They attach to
whatever your radio is with a couple of flat-head screws.They can be
easily mounted to a VX-1 by sinking a couple of holes thu the plastic
case. While slightly larger in size than the stock clip they are
somewaht smallr than the clip used on the Vertex radios. I have also
used one of these on my Standard C508. Steve DE WA1YKL

3793. FS: TenTec 10M<->2M Transverter

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-16 00:00:00 UTC

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

I've decided to sell the TenTec 1210 2M transverter kit I bought a couple months ago. Changing family circumstances make it unlikely I'll be able to use it.

It's the new 10M-to-2M kit that TenTec released at Dayton. Covers 144-146MHz using a 28-30MHz IF. It's similar in design & specs to their 6M xvrtrs...all modes (depending on your HF rig), about 8W out, according to the specs. It's unassembled...I opened the box and looked at the manual, but all parts are still sealed in the shrinkwrap. I'll sell it for what it cost me...$140, and I'll cover shipping via priority mail.

If interested, please respond via email.

There has been a production change in the 870 that will supposedly fix the
intermod problem. This change has been done since the QST review.
I believe Kenwood will fix the older models also.

I own an 870 and love it.

> W1HYV

CODE is obsolete but the test should remain hard if not harder..

Drop the code requirement and make all of the test at the General theory level, and require additional knowledge in Basic antenna theory and such. Make the license available to people with a genuine interest in all of radio not just the ratchetjawing, crappshooting, tying up the two-meter channel aspect. Ham radio was started by pioneers and experimenters not appliance operators. Code was the only method, not just a hazing ritual for keeping the has-beens by themselves on HF. NO-ONE in commercial uses code anymore and even the last bastion of support died with the Coast Guard dropped it as a requirement. Packet works much better. Leave code for the history books right next to the TITANIC...Jeff

3804. Vibroplex key

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-16 00:00:00 UTC
From: lawalker@ix.netcom.com
Message-ID: <33F59D2C.791@ix.netcom.com>
Source record: 167887

Would it be better to try to replace a broken part on a 1928 key with new part from vibroplex or fix the broken part by silver solder (has been fixed this way before, and has been rebroken) I assume the fix was done by original user (Train telegrapher).

3805. Autek keyer manual needed

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-16 00:00:00 UTC
From: John Frank <jfrank@mailbag.com>
Message-ID: <01bcaa54$c820d160$79b2adcd@jfrank.bind.net>
Source record: 167888

The Autek memory keyer (model MK-1) I bought from a silent key's widow doesn't work. The sidetone is on continuously and there are some modifications inside the unit. Does anyone have an instruction manual and/or a schematic for this keyer? If anyone can help, I will gladly reimburse any photocopying and postage costs. 73, N9CH

Bill:

If you should decide on a Kenwood TS450S I have one for sale.

Contains the following options:
-automatic antenna tuner
-YK88SN-1 filter (1.8 MHz)
-YK88C-1 filter (500 KHz)
-YG455C-1 filter (500 KHz)
-Kenwood hand mike

This rig is perfect, mint condition. Original box, manual. Will sell it for $1100 + shipping.

Also have:
PS50 matching power supply. Mint. Sell for $175 + shipping
SP23 matching speaker. Mint. Sell for $75 + shipping

Have original boxes and manuals for above, too.

$1300 + shipping for entire package.

Cuzic,
Go to Maxim's website and download the MAX038 data sheet. I's a bit
light on theory, but it has a schematic for a binary RF synthesizer that
you may be able to modify and use. The MAX038 is a function generator
guaranteed up to 20 MHz, but most parts work up to 50MHz. "Work" means
that square-waves, sine-waves and triangle-waves are very distorted and
look very similar. For a sysnthesizer, you probably don't care.

The address is:

http://www.maxim-ic.com/

Good luck, Larry Carr

> But does anyone know how Li-Ion cells fit into this matrix?
>
> Thanks,
>
> Fred K, N9SLR
Self discharge(shelf life)Li Ion best, NiCad second, NiMh 2x poorer than
NiCad.
Energy density Li Ion best(maybe 3x) NiMh, NiCad poorest.
Charge/discharge Li Ion most finicky requiring sophisticated multi mode
charger and discharge monitoring to terminate use at a specified cell
voltage. Easy to damage, system must be designed for LiIon.

NiCad fast charge by -delta V and temperature rise method-same for NiMh.

Slow charge for Nicad at c/10 rate almost forever. NiMh cells want a low
duty cycle pulse charge that averages c/10(dont know why)

Nicads have memory, NiMh has memory but at a greatly reduced rate and Li
Ion is free of memory.

Given two pieces of equiptment one with Nickel based and the other with
Lithium based Ill take Lithium. Lithium is the battery of the future

From: Mark C <mchaous@nwlink.com>
Message-ID: <33F5A685.AD2@nwlink.com>
Source record: 167896

I've been told that you should not put two antenna's with the same resonance freq's near each other. This could reduce reception sensitivity as well as transmitt.

Senaro: If I take a 10 meter verical and put it above a horizantal triban beam will this reduce the beams sensitivity on all three resonance freq's or just the 10 meter or non at all?

You could change to BAND FrEE and have RX from 72-540 and 590-999 and
TX 118-232 and 308-506, or to some other Country Band.

The Serial Nummber does not affect the Resistor Mod, it works on every FT50.

hi everyone thanks for reading this

i have been given a radio called MIDLAND sorry don't know the
model no.
there is just one pcb in this unit, and printed on it is:

TR-1519 HITACHI DENSHI LTD 1990

maybe this is the model no? but when i ask nobody knows.
the number on the synth chip is:
M37451M4-268SP
on one side of the radio is a 10 pin male socket which may be used to prog
this radio?? just a guess!
on the front of the radio is a single led bcd display, this makes me think
that it is poss only a 9 chan set.

if anyone can help with anything for this radio ie how to programe
it, what freqs can it work on (would like it on 144mhz)

pls send any info to HOWARD@NETCENTRAL.CO.UK

You might want to try Ladd Electronics on Dodge street. They're in
the midst of going out of business, but still had a lot of amateur
equipment left. There's also Surplus Sales of Nebraska, on Jones street.
The equipment there tends to be somewhat more vintage.

I was looking for the best of all worlds in the 2M-70CM bands. I wanted portability, power, range and features. I think I have it all.

I purchased an ADI AT-600 HT. It is dual band, 5 watt with many features for a reasonable price. This radio gave me features and portability.

I added a Maha MH-A302 docking booster with a Maha MHS-S1 adapter to fit my radio. Now I slip the battery and antenna off my HT and slide it into the docking booster and connect the antenna lead. Suddenly I have regulated battery voltage into the HT and 50 watts (2M) and 35 watts (70CM).

The last thing I installed was a Cushcraft CS-270M magnetic mount, dual band antenna.

I ended up with a powerful portable with loads of features and excellent TX and RX quality AND when installed in my car I have a full feature mobile with all the power that a permanent mount unit would have.

It's a great combination!

For Sale:
66 foot Self Supporting Tilt-Over Tower, very heavy duty....
this tower is about 11 years old and is in perfect condition,
it is topped by a 20 foot heavy duty mast.

items that go along with the tower.....
Hy-gain/Telex "Tailtwister" rotor and control box
KLM KT-34 4element HF Beam, about 8 years old...
cushcraft 2m and 220mhz yagis, and 2m AEA isopoles...
hundreds of feet of belden 9913 coax, rotor control wire etc...
I am moving and can't take this with me, this is all being
offered at the sacrafice price of $800.00 Canadian...
however, you must take it down, and remove it by August 30th.
if your interested give me a call at 519-542-8529 evenings, or
leave a message at 810-679-3535 anytime.
The tower is located at 874 Rosedale Drive in Sarnia, Ont.

Good point A.O.C.!!!!!!!!!!!
Code Sux and sooner or later we will loose our rights to xmit due to lack of use because fewer people are interested in learning code. If you want to use code, then take a test and get a license to do "just that"!!!! Leave the rest of us out of it. But I do believe I can communicate via voice or computer as well as the next guy, without having passed a CW test. Maybe we should also test for engish grammer before issuing a license for other than CW. Or maybe we should test for other technical expertise like being able to use an o-scope or read boolean algebra. I was learning this stuff when most of you were in your daddy's pants pocket, and I still don't agree with testing for code in order to use my radio. Life is constant change and if you don't change with it you die. We live in a world full of never ending change and its great because you never know what tomarrow will bring. All you hard core die-hards need to ask yourself where the internet would be today if a test of knowledge was required in order to hookup to it. Most of you would centainly be left out.

I've noticed several people have recommended GMRS for your
application. Unfortunately, (or rather, fortunately in my case!)
it's illegal for new licensee's to use GMRS for business purposes,
except in the situation of a family business. You cannot obtain a
license in a business name, and you cannot legally allow employees
to use your radio system under your callsign (unless they are in your
family). If you want to communicate with your employees (except family
members), they must obtain their own GMRS license.

You will hear a lot of business users on these channels, but they
have been grandfathered for several years now. GMRS is STRICTLY to be
used for personal communications for new licensees.

As someone else mentioned, if FRS doesn't cut it, consider the
so - called itinerant Business Radio Service channels, which
are available on both VHF and UHF. (Personally, I would use 2 to 5
watt UHF handheld radios for this application). The itinerant
channels require a license, but don't require frequency coordination
like other Business channels. Power outputs of up to 50 watts are
allowed on these channels, and the licensing procedure is fairly
straightforward, but you may need some help with some of the
detailed technical questions on emission type and such. Used
commercial equipment is readily available at reasonable prices.
Just follow the rec.radio.swap newsgroup.

3838. FT-50 HARDWARE mods (extended tx AND rx)

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-17 00:00:00 UTC
From: tvsjr@sprynet.com
Message-ID: <33f77ee2.2321075@news.sprynet.com>
Source record: 167763

I would like to clear up some confusion about the FT-50 modifications. I have an FT-50RD (sn XX18 etc.), and have transmit 116-200 and 350-500, as well as 76-540 and 590-999 recieve straight through, but I never did any software mods!

MARS/CAP mod for extended transmit:

1. Remove battery and antenna
2. Remove NI-CAD recycling label gently
3. Loosen the two screws (DO NOT touch the pots)
4. Push on the screws to pop out the keypad
5. Remove screws
6. Remove keypad, paying careful attention to the gasket alignment
7. Look for a row of chip resistors and three solder pads
8. Desolder pad 1
9. Reassemble the radio
10. You can now transmit out of band (do NOT use unless you have permission)

Extended receive mod:
1. Remove battery and antenna
2. Remove NI-CAD recycling label gently
3. Loosen the two screws (DO NOT touch the pots)
4. Push on the screws to pop out the keypad
5. Remove screws
6. Remove keypad, paying careful attention to the gasket alignment
7. Look for a row of chip resistors and three solder pads
8. Remove resistor one, closest to the side
9. Reassemble the radio
10. Set VFO A to 144.0 and VFO B to 430.0
11. Power down
12. Hold down knob, ptt and lamp and power up.
13. Display should read BAND -a1-
14. Just like a normal menu, change to read BAND free
15. Hold knob down to exit menu
16. You now have recieve 76-540 and 590-999 straight through

Using these methods, you will not have to put your radio in limbo and risk screwing it up totally.

BEWARE: This is the true information for the mods, but I am not responsible should you go ahead and screw up your radio. I am warning you here that improper equipment could trash your radio, and I can guarantee Yaesu will not pay for it. It is not hard, but a high power soldering iron could quickly melt resistors around.

Also, the mode you put the radio in to change the band is the alignment menu. If you put 430.0 in vfo A you will see a U appear next to the settings, for the UHF settings.

MENU OPTIONS-

BAND- Obvious
HSSQ- Hysteresis
THSQ- ?????
TISQ- ?????
S1LV- Signal level to register s1. Beware that this and S9LV are not adjustable via knob, but show the 0-255 of the signal currently being recieved. DO not change this without proper equipment
S9LV- Signal level to register s9. See above
HIPO- High Power power setting. Preset, could cause damageto transmitter if turned too high, but can be pushed on a 13.8v external supply.
L3PO- Level 3 power
L2PO- Level 2 power
L1PO- Level 1 power

This information I know is valid on an FT-50RD (ftt-12 keypad), came from an authorized Yaesu dealer :-)

Anyway, I hope I helped to clear up some confusion regarding mods for the radio.

The best low profile HF antenna I know of is the hamstick. The ones made by Transel Technology have a whip section that can be easily removed for storage. One for each band works out real well. They are at least 3dB better than Outbackers and compare favorably with Hustlers. They are less than an S-unit down from a bugcatcher of the same length down through 40 meters.

The best tunable is of course the screwdriver. It is only a half notch (non-technical unit of measurement, well below aural detection) or so below the standard, the Texas Bugcatcher.

On this newsgroup, the comments above are grounds for stoning. I'll standby and wait for the rock throwin'.

If you are looking for a single, multi-band antenna, you are probably going
to be looking at an Outbacker. They don't work well, but they do work and
the Outbacker Jr is small enough for a trunk lip mount.

Good luck.

Replacing the Resistor Back ?????

WHY WOULD YOU DO THAT ???

The removal of the Resistor enables you to switch from one Band to another,
If you mis the Automatic Repeater Offset you don't need to replace the
Resistor, just switch to Band A1 again and everything will be as it was
at your FT50 when you buy it.

No specifikations or anything else is changed by removal of the FrEEBAND
resistor (0 Ohm = Jumper).

Read the Texts on http://members.aol.com/aeimn/FT50/index.htm

There is a lot of useful stuff.

Don, I wonder just what "audio" you are getting since you have no
receive or squelch noise? Funny you should post this just now. I just took
in a Turbo 800 last week with no receive or display too. It draws 50ma to do
something though. I'll probably bench it in a week or two to see what ails
it.

Anyway, provide me with your address and I'll try to photo copy and send you
a copy of the schematics when I get a chance.

Hello! I'm looking for a cheap quickcharger for the Yaesu FT-50 dual band HT or any of the radios that use the same battery. The key word is CHEAP! If you have an old, dusty charger, even a broken one, send me an email. In fact, if you have any accessories aside from: Speaker Mic, Black rubber case protector, the 4mm DC jack, or the VX-1 belt clip, let me know. I might just buy it. Thanks!

Jeff,

Sorry for late reply - but I tried the 870 and bought the 1000MP.

IMHO the 1000MP is well ahead in most areas. Dispite what Kenwood claim, the DSP is still audio DSP, being at the 4th 'IF' of 11.3 kHz - as is the case in all current DSP rigs. I still think Kenwood paid too much attention to the DSP - admitedly they put in very flexible and powerful DSP, which is actually superior to most others, but you can't clean up the signal after it has passed through inferior/less good IF stages. In the review in RadCom, you can see the IF filters are actually quite wide and fixed, and Kenwood rely on the DSP (wrongly in my opinion) to clean the signal up. I think Kenwood now offer a narrower IF filter as an option.

Yaesu, however, have got things just right on the 1000MP - they have proper (and switchable) IF filters at both 2nd and 3rd IF, followed by the DSP - also at 'audio 4th IF'. My only derogatory comment re the 1000MP is that the DSP is a bit lacking, with only fixed noise reduction and audio tailoring options. However just like the Kenwood, you can set the bandwidth on SSB as you wish. The auto notch for SSB is also fantastic - but shows up the usual limitation as it is after the AGC and takes out the heterodyne - but may affect the wanted signal also. Still, it is little different on the 870.

IMHO, scrape up the extra cash/credit/whatever and go for the 1000MP. Until we get DSP at 'real' IF stages it is virtually the same in all current rigs and is useful but not vital and makes not much more than a marginal difference.

Cheers and hope the above is helpful, Bill, G0VDE.

3855. Thee Callsign database

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-17 00:00:00 UTC
From: James Sawle <qmation@dial.pipex.com>
Message-ID: <01bcaaf0$e7e74e60$e8f582c1@default>
Source record: 167812

Hello there,

Is there anyone out there that can help me with collecting callsign databases from around the world for a project that I have been doing for the last three years.

I have at the moment a database of Ham Radio Callsigns from the following areas:

UK about 60-70% complete
Northern USA about 30% complete
Southern USA about 40% complete
Europe about 40% complete
Asia about 20% complete
Australia about 5% complete

This database is in (PC Formatted) dBase 4 format and currently holds over 7.8 Million callsigns, names, addresses, locations, and notes if applicable.

What I am after is more information to enter into this database, If anyone can either e-mail a database with callsign information in dBase 3 or 4, or ASCII Text delimited. so that I can add the information to my database, in return I will send them the database as I have it so far (on CD-ROM), and when hopefully I can get to a stage where I can publish it, which I am aiming at later this year, I will send the the finished article FREE OF CHARGE later this year.

I look forward to hearing from you

All the best

3857. Re: Difference between Icom 751 and 751A?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-17 00:00:00 UTC
From: trinit69@idt.net.nospam
Message-ID: <trinit69-1708970810000001@ip38.lafayette.la.pub-ip.psi.net>
Source record: 167814

The 751A has standard a CW narrow filter, keyer, and I think, FM. All are optional on the 751. Also, there are many board differences, requiring separate service manuals.

Good radios. 751 was the Icom top-of-the-line at the time.

Your preferences for any radio depend on how closely it meets
your expectations. No one radio is the "best" in all respects.

I have owned a TS-870 since November 1995 and I was very unhappy
with it at first. My main interest is in contesting, CW and SSB.
I found the 870 almost hopeless during worldwide SSB contests and
I decided to sell it. However, I realised that it's possible to
replace the standard analogue 3KHz filters (in the 8 MHz and 455
KHz IFs).

I did so with a pair of International Radio 2.1KHz filters that I've
used in one radio or another for the past 10 years. They helped
considerably. Incidentally, the CW reception is better than SSB with
either the stock or the IR filters which is not what theory would
suggest.

If your sole or over-riding interest is in contests, the TS870 is
not the one to have. However, I have one radio only and it's the
TS870. I particularly like the superb audio on broadcast stations,
and on amateur SSB when the bands aren't too crowded. You should
try it with an external sub-woofer - you wouldn't believe AM could
sound so good. I like the keyer, the front panel sidetone level
control and the fact that I can hear the CW sidetone even when
listening to SSB or broadcast AM.

73,
Paul EI5DI

Source record: 167824

>GMRS requires a license. FRS is the new Family Radio Service, that
>requires no license. Fourteen channels with .5 watt power maximum. About
>a mile range.

I have the Maxon 210+3 GMRS handie-talkie. It isn't a Cadillac, but
it does the job nicely. However, there are other sources. I have
discovered most commercial radio shops aren't familiar with GMRS. It
takes some prodding, but I have found a few dealers.

I deal with a shop in San Antonio Texas called K-Comm. They handle
amateur equipment, and also commercial equipment. I talked with one
of the guys and he quoted me a price on a Yaesu Vertex UHF ht with
charger, battery, and programmed with all the frequencies I need for
500 dollars new. I also asked about a mobile radio and he quoted me
about 400 dollars new on a 45-watt Kenwood UHF mobile.

I think the best bargains can be found on the used market. It all
depends on what you are looking for.

3868. FT-50RD Solder Blob vs. Resistor Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-17 00:00:00 UTC
From: jrhodes@iti2.net
Message-ID: <33f74b70.85001851@news.zippo.com>
Source record: 167825

I've read that the solder jumper (blob) modification on the Yaesu ft50 is for the out-of-band transmit and the resistor mod is for extended receive. I hope this is right. Now, I've also read that one of these mods (the resistor, I think) causes the radio to lose it's automatic repeater offset.

Are there any bad effects from doing only the solder jumper mod? If I do this, I assume I'll lose all my memories and settings. Can I use the clone cable to clone those memories and settings from an unmodified radio into the modified radio? Will cloning from an unmodified radio have any bad effects?

The Electron Tubes Online shopping (ETOLS) is open !!!
July 29th, 1997
http://www.halfin.com/shop

To celebrate the 50th anniversary of the company, Halfin
S.A. has opened ETOLS.
The shop contains more then 400 types and each week, new
items will be added. The ETOLS team is working to provide you with
online
information about each tubes presented in the shop using pictures
and/or datasheets.

ETOLS is the first Electron Tubes Online Shopping facility
on the Internet offering direct buying with Visa and/or
MasterCard.
http://www.halfin.com/shop/index.htm

ETOLS is not just a shop. We would like that this site to
become a real center of reference for tube lovers. This project can
only
develop with your participation. The members area provides many links
to
interesting Web sites containing Data Sheets, technical informations,
useful software, fonts, symbols and advise to everyone from
beginners to experienced users.

We can also give you the opportunity to publish your
technical or artistic projects, schematics or simply opinions related to

the tube usage. Any suggestion to improve the members area are
welcome!

The members subscription is totally FREE and any tubes
lover opinion will be appreciated.

Hi, I've got for sale on Ebay's Auction Web a:
Antique Majestic AM/Police Tube Radio, Model 666, 6 Tube: 2/ G-58-S, G-2A7-S, G-80, G-55-S, G-2A5. Frequency coverage is the AM Band, with a Police band at the top end of the AM band. Dimensions 38" Tall, 10 1/2" Deep, 19 1/2" Wide, 12" speaker. The case is in sound restorable condition, although, I think there is a piece missing that would sit on top, and is decorative. The fabric covering the speaker area is thinning on one side, one knob on the side is missing.
40 lbs S&H, please e-mail me your zip code for accurate shipping costs. Thanks for your time. It's URL is:
http:www2.ebay.com/aw/itemfast.cgi?item=agk87201

3878. Kenwood TR-7950

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-17 00:00:00 UTC
From: N1PPR <herkimer@top.monad.net>
Message-ID: <5t875b$q0i$1@news.monad.net>
Source record: 167835
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Thanks for reading!!

I am the lucky owner of a rather antiquated, but powerful Kenwood TR-7950 2m mobile radio. It is in fine condition and has worked well all the time that I have had it, but there is one thing that has been a constant drawback. I cant generate PL tones with it. It has a menu (a very simple one) in which you can set tone 1,2, or 3 which I am assuming are preset or hardwired PL tone settings. Since I do not own the manual I really have no way of knowing if it is possible to reset them or if they even are referring to PL tones. I really would appreciate your help in that I have so far been unable to even find anyone who owns a 7950 much less knows how to modify it.

Thanks! - 73's - N1PPR - Matt

(I have been told that I may need to aquire a PL tone board to install in my rig, if this is the case any suggestions of where I might find one would be very welcome)

Astrons all have an internal, resettable crowbar device. It is
supposed to automatically reset after cycling power on the unit. I
have an Astron 50amp which crowbarred after a lightning strike. I
cycled it and it works fine. My bet is that the crowbar unit (which
should be very well protected with shielding) is screwed up.

You don't even need to do a software mod!!!!!! Remove solder pad 1 and
the first resistor above it. Then, you will have transmit (about
118-200 and 350-500) due to the solder pad, and then do this:
Set VFO 1 to 144.0 and VFO B to 435.0. Hold knob, ptt, and lamp while
powering up. Like a normal menu, select the band menu and turn it till
it says "free". Now you have 76-540 and 590-999 straight through.
Don't mess with the other settings until you know what you are doing,
because you can royally f*** up your radio. I know this works for the
FT-50RD (sn XX18 etc.)

Thus, you do not have to do anything weird with the software to get
what you want. The resistor is SMT, so you will need fair experience
and a low-wattage, pointed tip soldering iron. (A Metcal works great!)

Larry,
Without knowing what part is broken, it is difficult to say which
path might be best. You might find that new parts are not a
dirrect replacement for the old one.

If you do a little searching on the WWW, you'll find some
pretty comprehensive telegraph key pages. Some of these folks
can give you better advise. They may also have a few junkers
around that they use for parts.

There is one site that may help you establish and exact date for
your key, as well.

Good luck with the bug.

Don-

The balun is essentially a 1:1 voltage transformer in the case of the 1:1
impedance BALUN, or a 2:1 voltage "auto transformer" in the case of the
4:1 impedance BALUN. Impedance ratio is the square of the voltage ratio
or the turns ratio.

I would expect that the higher current/lower voltage would lower its
maximum power handling capability, due to saturation of a ferrite core.
Going from 75 Ohms to 50 Ohms won't make much difference otherwise. If
your BALUN was designed for a KW and you are only running 100 watts, then
you probably won't notice any difference.

> OPINIONS EXPRESSED ARE MY PERSONAL ONES AND
> DO NOT REPRESENT THOSE OF MY EMPLOYER

The 7950 used a tone board with 3 sets of diodes that were cut,
according to a chart, for 3 separate tones. The front panel selected one
of the 3 preset tones to use and memorized which tones went with which

freq in memory. An improvement over the previous generation which only allowed 1 tone but not up to current standards which has all of them.

The alternatives are:

1. find an original tone board (TU-79)
2. install an aftermarket that is preset for only 1 tone.

That's about it..

Harvey, I just couldn't resist. Its always more fun being the spear thrower than the spear catcher hihi. I agree with your comments with respect to the relative ordering of the various antennas. I own an Outbacker, Ham Sticks and a Fortex Stealth Bugcatcher antenna. If you want the best, get a Fortex Stealth.

I think one S unit is well worth going for when you are mobile. As well, you didn't mention how the hamstick performs on 80 relative to a bugcatcher.

Cheers my friend, de Karl VE6KBS

I have to agree with the earlier post on the Kenwood TH22AT. I also own one and I find it to be a Great 2meter HT. Depending on what kind of power you want to have you can get a 3watt or a 5watt version. I got the 5watt version durina Kenwood sale and spent about $250. I thought that was a great price. Happy hunting.

> jwrobles@d.umn.edu
I used to have a cobra 148mobile rig that covered both cb and 10 meters
up to 28.500.It started off with just the normal out of band cb mods to
the pll(miniature toggle switches on the side of cabinet to change the
states on the pll programming pins).That brought the radio to 28.045.
Thru a local cb shop i bought a kit that added fm and 40 channels to the
radio.It was very simple to install but alignment was tricky.With both
mods,the radio worked well on 10 meters.The company that i bought the
kit from is no longer around but i'm sure the kits are still available.
you might try a few of the urls below for some leads.

http://www.iglou.com/copper/

http://www.bills2way.com/

i have the origional instructions for the fm mod kit but it has no id
for the company who made it.It was made for the cobra 2000 wich was the
same as the 148.
good luck

Jeff:

From a previous post:

>it (the 1000MP) is after the AGC and takes out the heterodyne - but may affect
>the wanted signal also. Still, it is little different on the 870.

Wanted to make a quick comment/correction regarding the IF notch filter on the 870. It is _outside_ the agc loop, and when used properly there is no noticeable degredation on the desired signal. It doesn't work too well for extremly high tones (AF works better) but for most signals in your desired passband, works like a charm, eliminates the carrier, without attenuating or distorting the desired signal. You should, however turn the 870 'tracking' menu option off...for best results after the carrier is nulled, otherwise you will hear signal distortion.

Good luck with your choice!

Thanx to some fellow news/hammers, My understanding of the hardware v. software mods is becoming more complete. I have a few more questions.

As you know, when you switch into band=free, you lose the ARS. As I understand it, it's because there is no band plan database loaded for this mode since it can't assume a country or something like that. They are not permanently gone so if you switch back to A1, it can once again figure out which repeaters have + and - offsets.

Q: Has anyone figured out how to load the US band plan in for the free band mode? I thought I read that someone was trying to write into that memory.

You can't up or download to/from the radio if you have a normally blocked 800MHz freq in your memory database. I think this started with a newer version of ADMS-1C

Q: Anyone figured out a way around this? A patch of some sort so you can program, say, L1 and U1 limits using the s/w

---

Q: Anyone run across any library of .RDF files out there?

> the time.

That's funny because the FT-10 does does have about a 1 second timing loop before the radio turns on. But, the FT-10 has a lot of things the FT-50 does not- true priority scan, muting during pri scan, faster pri scan, quieter synthesizer, no need for a lithium memory back-up battery, etc. Maybe Yaesu combined the best of their software features in the commercial VX-10 version.

3915. Question about baluns

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-18 00:00:00 UTC
From: Don Gray <lbol@panther.uwo.ca>
Message-ID: <01bcabeb$7e1faa80$0100a8c0@don>
Source record: 167723

Thanks for reading this.

The baluns that I have seen for HF are usually 1:1 or 4:1. The 1:1 matches balanced to unbalanced and the 4:1 does the same but transforms the input impeadance to 1/4 the output. i.e a 300 ohm folded dipole can be fed with 75 ohm coaxial line.
My question is; in the case of the latter, are the impeadances specific at 300/75 or does a 4:1 transformation occur to what ever the load impeadance is ? i.e. could the same 4:1 balun be used to transform a 200 ohm antenna to 50 ohms (coaxial) ?

Thanks in advance for any responses.

Don

Code is obsolete if you don't know it and choose not to learn it.
Learning basic math is also obsolete, hey, you have handheld calculators
and all these computers to do the math, why should you have to learn any
of it? (Grade school kids are not even required to learn multiplication
tables any more) It's called personal skill and independent thinking.
The ability to think, function and do real effective and productive
things without being totally dependent on technology. Not to worry,
nothing can gowrong gowrong gowrong gowrong gowrong gowrong....

The Boeing 747 that crashed in Guam last week---Guess what--officials
later said that the glide slope approach system was out of service but,
no problem- pilots are trained to land without it. BUT--the radar low
approach warning system was malfunctioning as well, unknown to anyone.
You can bet that the pilots were relying on it, knowing that the glide
slope was out of service. Failed technology equals tragedy once more.
Hey, I love all this hi-tech stuff and it's getting more delightful and
reliable all the time. But give me a good, trained effective human
backup for when it fails, as it must. Those who don't understand this
put us all at higher risk. With official use of code declining around
the world for monetary reasons--equipment is cheaper than personnel

maintained for a rarely used backup system--it is all the more reason for ham radio to retain it so that SOMEONE will be able to serve as communicators when it becomes necessary--as it eventually does. It still happens regualrly--read the posts, it you choose not to ignore them.

Earlier this year a ship on the North Sea had a wave crash through the windows in the bridge knocking out all the electronics except a CW rig on 500kcs, and disabling the ship which began drifting toward an island. They sent an SOS on CW that was heard by a shore station in Belgium who sent a tugboat to tow the ship before it ran aground. (posted on a Maritime newsgroup)

Code Obsolete? No more so than your basic math skills when a calculator is not at hand. 73, Dick W0EX

There is a big technology change underway. Transceiver design is moving to Digital signal processing techniques from the well known Analogue techniques. Although such devices have now been on sale for a few years, we are still only at the beginning of the change, for the best DSP based radios cannot yet outperform the best of the old analogue ones.

On transmit, the DSP radios are genuinely marvellous. The dynamic range of the audio from a microphone is not particularly taxing, and the audio can be digitised without any significant problems. DSP modulators can offer excellent carrier and alternate sideband suppression for SSB, and can make well-shaped Morse envelopes. Waiting in the wings are DSP based speech processing techniques which could make the proverbial mockery of the classical audio and RF clippers.

On receive, things are very different. The dynamic range requirement is very severe, and the analogue to digital converter stage is the bottleneck. Once digitised, wonderful things can be done, but any intermodulation of the multiple signals presented to the ADC cannot be undone. The TS 870 is a bold move to the architecture that will eventually be used, but I think that it is a bit ahead of its time. ADCs are not yet available that are good enough to allow the prime selectivity of a receiver to be put into its DSP section. Some of the adverts have mentioned 24 bit DSP processing and 144 dB dynamic range. Certainly, a 24 bit binary number has effectively got 144 dB of dynamic range, but if you use fixed 24 bit resolution arithmetic and do the very

large runs of repetitive calculations needed to implement a digital filter, cumulative errors due to truncation and rounding can dramatically bring down the dynamic range that can be handled. On top of this, the ADC imposes its limitations.

Some other DSP based radios get around this by using classical Xtal filter options ahead of the ADC. This is, currently, a better compromise, but really amounts to a classical analogue receiver, with what behaves like a built-in audio DSP box.

For a once-in-a-lifetime purchase, I'd suggest you skip the next generation or so, and wait for a DSP based radio that can meet or exceed *ALL* of the capabilities of the best analogue boxes (IC765, FT1000D, Omni)

May I suggest you dig out the RADCOM review of the TS870. Peter Hart found its chief vulnerability - poor intermodulation performance with close-spaced signals, and described it well.

I've had a careful look at the FT1000MP, the IC775 and the TS870

I reckon that the 1000MP and the 775 are fairly similar, and that the 775 was pretty equivalent to my existing IC765, though with what amounts to a fairly useful post-filter DSP. On transmit, the IC765 is clean, and has a particularly good speech processor - the 775 is better, though.

The TS870, though, is the really interesting one. It shows where the pure DSP art has reached at affordable prices. I wouldn't swap my current analogue radio for one in a doorstep challenge, but this is the approach to watch.

These are strictly my own personal opinions.

Interesting times, eh?

Hope this helps a bit,

David GM4ZNX

[about the VX-1R]
>This one doesn't
>crossband repeat, dual in band receive or any of the usual features of a
>good dual bander.

The VX-1R, like the FT-50R, is a *dual band* radio in the sense that it will transmit in both the 2 m and 70 cm bands. They do that fine. In addition, they have very wideband reception.

But the features you ascribe to a "good dual bander" require essentially two complete transceivers in one box, so you can receive and demodulate two frequencies simultaneously, or receive on one frequency and transmit on another. These features are nice, but they are unlikely to show up in the VX-1R (or FT-50R) any time soon. That would require a completely new design for the RF section of the units, not just new software.

Dave

I have an SB-1000. The plate choke was burned out and replaced with a rewound one; it was not totally satisfactory, so I rewound it myself according to the specs in Bill Orr's handbook for an 80-10 meter choke. I'd still like to get an original replacement, though, that would work for 160 meters -- does anyone know where?

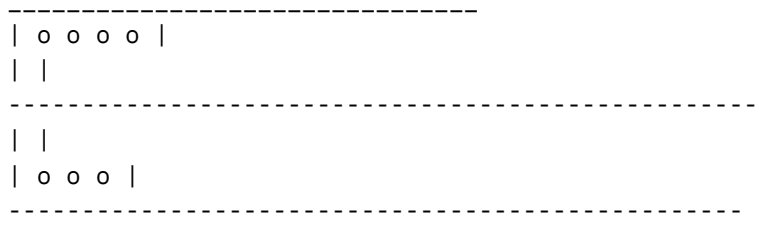
3925. GE MVP for repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-18 00:00:00 UTC
From: "Matthew W. Steger" <n3ntj@erie.net>
Message-ID: <33F910CE.3655DE82@erie.net>
Source record: 167733

Hello...

I found the mods for the GE MVP radio to make it into a 440 MHz repeater. I performed most of the mods except for the heat compensation one. I have one question that I hope someone can answer. What are the connections in the rear of the radio? My MVP has (doing this from memory now....) a connector on the back with 4 pins (and an empty pin hole next to them) and one either above or below it that has 3 pins (and 2 empty pin holes next to them) . For some reason, I think the MVP has two +12V DC lines.
I see the grounds shorted right to the case. I don't remember if the 4 pins are on top of the 3 pin connection or the other way around. The connection for the mike audio (documentation says J913) was really tough to find since the SAS board isn't labeled (well...I guess GE doesn't believe in that). I took the mike audio at the upper left corner where there is a yellow wire being jumpered to a pin. I soldered a wire for mike audio at the base of this pin.



It looks something like that...there is an empty hole at the end of the 4 connections and 2 empty holes at the end of the 3 connections. This may not be exact but it looks something like it.

If you can help, I'd appreciate it..

>Which is the best???? I know everybody has a pref. mine is the 1000D.

No one can really answer this. The "best" to whom? I believe
the the CW operator, the OMNI VI may be more desireable (but
the 1000 is no slouch) and for the SSB operator, the 1000 may
have nicer features (but the OMNI VI is no slouch). If you want
the station in the box, the 1000 is cool with a p.s. and tuner
built into the box. If you like to work on your own gear, you
will probably be much happier with the Ten Tec.

I have had both side by side and a guy wanted to swap me even
up for my OMNI VI (it was a 1000 with most of the options making
it a "D"), and after a week I decided to keep the OMNI, mut
some days I wonder about that. Most of the time I am hapy with
the OMNI.

You can add the Kenwood 950SDX to this crowd too. It is a very
nice radio. Each has its strengths and weaknesses, your own
mileage will vary according to your needs.

Don't get either one. Buy a hand held scanner which was meant to cover all the frequencies you want and has the appropriate antenna. The little VX-1R has fair to poor receive on freqs out of its transmit range. The FT50 is little better. This improves considerably when you change antennas, but then you can't transmit. They're both very intermod prone. The VX1R has quite a few other programming and design flaw also and the consensus is to wait until Yaesu comes out with an improved version. This one doesn't crossband repeat, dual in band receive or any of the usual features of a good dual bander.

> K0IET

Depends on the model of your Vibroplex and what is broken. If its the standard model and the vibrating leaf spring is broken you might be able to buy a new one, but the finish may not match. Many older bugs were nickel plated as opposed to the later and current chrome. Also, I understand that the only model currently in production is the Standard, and that no parts are available from the factory for out of production models (there are several). Probably the best bet is to determine exactly which model you have if not already known and advertise on the web for the part. There are lots of junkers around, especially the common models. More people are interested in these things than you would imagine. There are some good books out on the subject. 73, Dick W0EX

3945. Help - Kenwood TH28 starts with error

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-18 00:00:00 UTC

I charged up and turned on my Kenwood TH28 for the first time in a few years, when it comes up the screen displays odd characters and doesn't transmit. I remember it working just fine the last time I used it. Does anyone have any idea whats wrong here, and how to fix it? Does anyone want to buy it?

Please Email back

Someone has borrowed my HT220 service manual and not returned it, and in the meantime I just got a couple more HT220s which are in need of alignment. If anyone has a spare manual, I'd appreciate it.

Also, of course, if anyone has any old crystals for HTs kicking around, I would appreciate it. I know everyone pulled those itinerant band crystals out to move them over to 2M and they are kicking around in your bench drawers. I need a couple pairs for 154.600 but also probably wouldn't turn down 2M crystals you aren't using.

Matt:
I don't believe that the 7950 has a built in tone encoder. I have the earlier model 7850 and I had to add a Communications Specialist encoder module to it. I do believe that Kenwood supports that radio and I have had no problems getting parts for the 7850.

Good Luck, Dick, K7RNZ

I have the following for sale:

1) Kenwood TL-922a amplifier, w/10meter mod. Absolutely beautiful condition. Full output. Have original box, manual, service manual. This amplifier is very nice and
NO I DO NOT SMOKE!!!!!!!!
I got a new amp and do not need 2 or I would keep it.
Asking $1,100 or I will take offers.

2) Kenwood TS-120s. This radio is in excellent condition and works very well. Has the large mobile bracket, hand mic, and power cord. Asking $350 or offers.

3) Gap Titan DX antenna. I just put up another tower and wife says something has to go, so this antenna is it. It is an excellent 80-10 meter vertical that I have been very happy with. The antenna is 4 months old and is still on its ground mount. I will bring it down and disassemble it for shipping. Asking $250.

Thanks for reading my post and reply to me at the E-mail address below.

Yes it needs the Kenwood PL board which is no longer available. I have two of
them. One with PL which is used for voice and the other w/o PL which makes a
great packet rig. It is possible you can get a third party PL board but it
will not be programmable from the panel.

Source record: 167605

I have been using a Diamond SRH519 144/430Mhz and Wide Band that comes w/sma connector as stock.

I won't use an adapter because it provides a longer torque arm to damage the connector in the HT. You may consider this issue.

I made 3 adaptations to the Diamond--all with shrink sleeving. At the base, I used and unshrunk piece of tube to fill in the gap. At the point of the "bullet" where the flexible part comes out, I used 3 overlapping pieces of shrink tube to add some stress relief. At the tip, I used a small piece of shrink tube to secure the "cap" on the end.

Rat-tails won't last forever but I have been very happy with the performance and keep the stock as a spare.

Source record: 167609

Hi,

I just received my Omni VI Plus and (as a CW operator) it is a VERY nice radio. Mine has the 500 Hz filter and is very nice. The first station I worked was in Ukraine with a 599. So far I think it is a super radio. I never operated a 1000D or 1000. They sound like nice rigs, but too expensive for me. :-)

I guess it is just operator preference. I like CW and only operate phone occasionally, and therefore I think the Omni VI will be just right for me.

73, cu on the bands !!

Chris;

I, too, am looking for UHF TX mods for the unit. I have sent for mine, but have not received it as yet.

I'd like to make this unit TX on the UHF commercial band. (465 Mhz, as an example.)

If you do get some info, please forward it to me. (Thank you!) I will do the same.

Thanks! -Mike- K0JTA

3972. Info wtd: Hammarlund SP-600

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: jbmitch@vt.edu
Message-ID: <5tcoq1rte1@solaris.cc.vt.edu>
Source record: 167611

I recently acquired a SP-600 and am looking for info from those who are familiar with this old boatanchor. I looked for the "boatanchors" newsgroup to post this in, but it is no longer in my list of groups, so maybe it has gone away?

Questions: What is the significance of the two numbers following the JX in the inside label? Mine is a JX-37, and some friends think it may be one of the latest models manufactured. Anyone know more about this?

The antenna jack uses an unusual SO-239-like device that has two, rather than one, center conductor. An old ad for the radio mentions "diversity" receiving capabilities. Is this related to the unusual jack, and how does it work?

I would also be interested in modifications for performance, stability, etc., that may be extant.

Any source for a usable rack mount cabinet in good condition would be appreciated.

thanks,

73,

John

Yes, but it will cost you more than the price of a used dualband
mobile. Unless you're concerned about someone stealing it out of your
car, the separate mobile rig is cheaper and better.

Having said that, I'm still going to put an antenna and speaker
in each of my cars...if I can find the plug.

Has anyone found a source for the plug in the bottom of the C510A?
$100 per (non-amplified) mobile adapter is a bit much.

miker

A suggestion if you are going to test higher bands. Try to establish
a network of listening stations scattered around the country. My
recollection of the testing method used for the 75 meter shoot out
really only measures ground wave propagation. Many of us running
mobile also like to work sky wave on 40, 20 (and maybe some day
above should the sun spots return, sigh.) Although the reports won't
be calibrated as our the local field strength measurements, they
should give some basis for comparison. Just a suggestion from
another mobile operator that is hoping screw drivers don't fare quite
so poorly on the upper bands.

When it comes to HF, packet generally sucks rocks. You can, however,
live with the throughput from Clover or Pactor. Your best bet is to get one
of the Hal P38 cards from Hal Communications. It's a nice DSP board that
sells for around $375.00, and runs rings around the competition in its
price class.

A satisfied consumer,

It all depends upon the individual and what your operating preferences are. Personally, I'll trade the one S unit for a less obtrusive, lower wind resistance antenna - but that's me.

I'd like to see some of the "shoot-outs" done at 40 and 20 meters instead of just 75 meters. I agree the ham-stick type of antennas can't compare to a bug catcher on 75 meters. It would be nice to have some real tests on how they compare on the other bands for those whos primary interest is not 75 meters.

I agree - forget HF packet! At least do Pactor with one of the
multimodes. I think you'll find the worst Pactor unit to perform better
on HF than the best packet TNC. The HAL P38 is a good deal for HF
(Clover, Pactor, Amtor, and RTTY). The SCS or PacComm Pactor-II
controller does HF modes plus VHF/UHF packet if you have big bucks to
spend (about $1000).

Andy;

You seem to be well versed in this new, and exciting product. (I
have ordered one, but have not yet received it. Shades of UPS??)

I have a question: Is this unit MODIFIABLE to transmit in the
commercial band? (Like 465 Mhz.)

Maybe some one that reads this posting will have some information.

Thank you! -Mike- K0JTA

I have an AEA PK-232MBX, by AEA. I am selling it due to lack of need/use. It is in perfect operating condition. I have all manuals, ans some assorted "extra" packet books.

You can see more info on the packet system at the following:
(-This is part of my web page)

http://homepage.rconnect.com/mikeats3/sale.htm

Just to bring you "up to speed" on this, and related, I will list a few points on the system I am offering, as follows:

==========
The unit started out as a PK-232. I purchased (and installed) the upgrade kit (at a cost of about $110.00) soon after I received it. This brought it up to the PK-232 MBX series, or level.

All software is included. Two manuals are included, one being the revision/change book, as the 'MBX offered a lot more "stuff", as compared to the original configuration.

I am selling, due to lack of use. I originally got into packet to communicate with a friend of mine, when he moved to South Dakota. He has now returned to Minnesota, so 2-meters is now doing the job.

Operationally, the unit works perfectly. (And still does.)
The unit is now on the air, on 145.050 Mhz. It is a "presence", but un-needed. (It is presently set up as a DIGIPEATER, if anyone has a need.).

The ROMs are by AEA. (This was part of the upgrade kit, mentioned above.) When I fire it up, I see the following:

AEA PK-232M DATA CONTROLLER
COPYRIGHT (C) 1986-1995
RELEASE 13.SEP.1995
VER. 7.1
PACTOR S/N 26192

I think I got this upgrade kit sometime in the previous spring, as
I recall. (More than a year ago.)

I have all of the original documentation. I THINK I have the
original box; not too sure...

- - - - - - - - - - - - - - - - - - -

I can add another point on this system: I originally got into
Packet to communicate (email) with a pal of mine, as I have described,
above. I originally purchased a MFJ-1270B. It worked just fine. A
friend of mine insisted in giving me this PK-232, as payment for
some past repairs, etc. This was OK, but as received, it had no ACTIVE
MAILBOX. (I had to leave the computer ON in order to be able to receive
(and save) any email! I let it sit for a period, then decided to see
just what all the hoopala was about these AEA units, and sent for the
UPGRADE KIT, which had (among other features) the coveted mailbox
function. I liked the AEA better, so sold the MFJ unit. That's where
we sit. As I mentioned, I no longer have the need for this system, as I
don't have the time, or need any longer. I do realize that this system
has a lot of neat stuff to do for me, but I simply am not able to devote
the time to this hobby any more.

The attached radio is a KDK 2033. It is synthesized, digital
display (LCD), memories, scan, and all that. 20-25 watts, as I recall.
Books included. It is modified (minimally) to mate to this packet
unit. (It even employs a sense line to consider the squelch opening, as
opposed to the more conventional "random timer" that is so commonly
employed to avoid "collisions" of the transmitted data.) It has a
touch-tone mic, and an "Astron" style power supply. All in perfect
condition; all works and looks as new. $150.00 for the radio/power
supply package.

-All wired, and working as a system at this time. (Remember? -I
said that the system is on the air at this time.) No adjustments
needed, the radio's normal VOLUME CONTROL is independant of the packet's
audio input. (Nice to operate like this, as the volume control is
normally the ADJUSTMENT device for the packet's input level...)
==========

So, as you can see (after digging your way through this LONG
mess!), the package of the packet, radio, power supply just may be if
interest to you.

Thanks! -Mike- K0JTA

Bill;

I, too, am looking for UHF TX mods for the unit. I have sent for mine, but have not received it as yet.

I'd like to make this unit TX on the UHF commercial band. (465 Mhz, as an example.)

If you do get some info, please forward it to me. (Thank you!) I will do the same.

Thanks! -Mike- K0JTA

I am interested in purchasing all kinds of compressor/ amplifiers, older microphones, mic preamps,mic mixers and other professional broadcast and recording equipment for my collection and recording studio.

Loking for Turner model 77 and 87 microphones, Sennheiser model 409 mics

Brands such as Neumann, AKG, Telefunken, UREI, Teletronix, Altec, Gates etc.

Especially interested in anything by Langevin and RCA.

The older the better, and basket cases are always welcome.

Thanks in advance.

-All wired, and working as a system at this time. (Remember? -I said that the system is on the air at this time.) No adjustments needed, the radio's normal VOLUME CONTROL is independant of the packet's audio input. (Nice to operate like this, as the volume control is normally the ADJUSTMENT device for the packet's input level...)
==========

So, as you can see (after digging your way through this LONG mess!), the package of the packet, radio, power supply just may be if interest to you.

Thanks! -Mike- K0JTA

3996. Opinions wanted: C510 vs VX-1R, C558 vs IC-W32

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: Greg Dean <n9nwo@gte.net>
Message-ID: <5tcgmi$bb4$1@gte1.gte.net>
Source record: 167667

I am looking at buying a new handheld. Several folks in the local club have bought the VX1R and our hamfest, the C510. I think I like the C510 better. I has more power out of the box (1W vs 500mW), runs on AAs and has the mobile power amp (makes it look like the C5718). The C510 also comes with 200 memory channels and is easier to work with than the Vx1R.

What I am really interested in compairing is the C510 vs the IC-W32. I like the Icom over the Standard C558. Just seems like a better package. However, the C510 has an appeal. It is much smaller, a little harder to work with but still most of the features of the IC-W32. If I add the MAHA power amp to the W32, the C510/amp cost is about the same.

Costs: IC-W32 C510

radio $450/$499 $279/$247
Amp $165 (MAHA dual band) $395

4001. Yaesu VX-1R and ADMS-1D

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: mayt@gw.twc.com
Message-ID: <872012664.14486@dejanews.com>
Source record: 167672

Rumor has it that the new version of ADMS-1D software for the Yaesu VX-1R (October) will allow ANY frequency to be stored in ANY memory. This overcomes a major limitation of the VX-1 that forces only frequencies within the band to be stored in a bank. Once frequencies from any bank have been stored in the bank, the radio will scan all the frequencies in the bank! I have NOT seen the software, but this information comes from a reliable source. If the radio can accept any frequency, why did Yaesu "design out" such a useful feature? Well, I can't wait until October?

One thing you should think about is how the wiring will end up. With
anything other than the 510, you can get quite a mess.
You need an external antenna anyway, so that's one cable from your
handheld to the car. It's easy to add a "booster" amp in that cable for
more RF output power. But with a better antenna, your handheld will
be more susceptible to intermod, so you may want to add a bandpass filter
in the line to the antenna as well. Now, the "booster" will be wired
into car power, but the handheld is still operating off batteries. To
use external power on the handheld, you need another cable between
the handheld and the car. Finally, if you want a larger external
speaker for better or louder sound, you need yet another cable going
to the external speaker jack.

At this point, you have most of the attributes of a mobile rig, but your
handheld also looks like a porcupine with three different cables
connecting it to the car. You can tie them all into a nice bundle,
but you still have to make three separate connections when bringing
the handheld into the car.

In comparison, it looks like the C510 would be far nicer. It provides
external power, RF amplification, bandpass filtering, and amplified audio
to an external speaker all using a single cable to the handheld.

Yes, the coupon is from Kenwood USA for $200. I saw the TS-570D for
$1380 at two websites. Take off $200 and you pay only $1180 for a HF
radio with DSP and auto tuner. There is no coupon on the TS-570S (six
meters).

I agree. I believe the difference between all these antennas is much
smaller from 20 meters and higher. Perhaps test all antennas on :
80,40,20 meters.

I bought a 570 when they first came out - had both an 850 and 450 at the time. I absolutely LOVE the 570, so much so that I quickly sold the other 2 radios and banked the money for later hobby use. While the 570 may be considered a "junior" version of the 870, I think it's performance in MOST areas is VERY competitive, and in a FEW, actually superior! Tho the DSP is audio derived, it seems VERY competitive to the DSP in a close friend's 870. Anyone waiting for a good buy in an *EXCELLENT* rig, NOW'S your chance!

I certainly didn't intend to criticize the shootouts or the people who put in all the effort to conduct them. Just making an observation that a comparison on 75 meters doesn't necessarily apply to all the other bands.

Historically 75 has been the band of choice for local HF mobile work.
With the exception of 160 it is also the most difficult to do mobile.

These are the reasons the various shoot out groups do their testing on
75. If you guys want to do a shoot out on other bands build the field
strength meters and have at it but don't criticize those that actually
do something because they don't do just what you want them to do.

You guys run a shoot out and do it any way you like. I saw how much
work went into the Santa Barbara event and those guys should be thanked
for the effort not second guessed by those who do nothing.

Jerry

4013. Motorola Sport 10X Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: Hubert Lai <hubert.lai@ubc.ca>
Message-ID: <01bcacd3$a7deba80$234c5289@hl.ubc.ca>
Source record: 167684

I am not sure if this is the best place to ask this question. If there is a FAQ, please let me know and I'll look there. In the meantime, I have a very specific question: Does the Motorola Sport 10X radio work with a standard mono 3.5mm earphone?

The reason I ask the question is that my wife and I have custom-molded earpieces which have standard 3.5 mm audio inputs. They also feature 26 dB of noise attenuation. Their mission in life is for use on our motorcycles to cut out ambient noise while allowing us to communicate with one another by radio. We wanted to use the Motorola Sport 10X radio, as we had heard good things abou it and it is reasonably priced. However, I have been receiving conflicting information about whether or not the audio output on the Motorola is a standard 3.5 mm jack.

Ultimately, we also intend to wire microphones into our helmets, so it is also important to know whether there is anything non-standard about the Motorola's microphone input. Thanks!

4020. Yaseu FT-73R with 5 KHz channel spacing

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: Joe Wilkes <no_mail@bell_core.com>
Message-ID: <33F9E46E.64ED@bell_core.com>
Source record: 167691

I have 2 FT-73R radios that have channel spacings of 12.5 kHz.
The repair manual states that the radio will do 5 kHz channel
spacing if a crystal is changed from 12.8 to 10.24 MHz and
some jumpers are changed.
I know all repeaters in this band are on 25 kHz channels but
I have a special need for set the frequency in 5 KHz steps.
Has anyone successful performed this modification?

4023. GE MVP repeater

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-19 00:00:00 UTC
From: "Matthew W. Steger" <n3ntj@erie.net>
Message-ID: <33FA5AF0.E9267FF9@erie.net>
Source record: 167694

Hello...

I found what 2 wires at the rear of the GE MVP UHF radio were for +12VDC (the two bottom wires near the back before they go into the small in-line filters). I ran the CAS, TX audio, RX audio, and PTT to a controller that I know works, and no RF out.
I performed all the mods according to the QRZ CD ROM mods, except for the heat compensation diode one at the end. Turning the radio on, the LED on the front does come on. I ran the 4 (CAS, TX audio, RX audio, and PTT) to the correct pins on the controller, and connected the duplexer/antenna to the radio, keyed up on the input and output frequencies, and still nothing. I plugged in the hand mike to the radio and the red LED on the front of the radio, does get brighter when I key up the radio's mike.

I cut the two traces on the SAS board, removed the antenna relay, connected a short coax jumper from pins (that I think are 4 and 7, as worded in the mods) and to the regular SO-239. I took out the RCA to RCA jumper from the radio and connected the coax from the rx side of the duplexer to the first RCA jack near the front of the radio (via 9913 coax and an RCA jack). I cut the connector that plugged into the filter board (which I believe fed DC to the antenna relay), since I removed the relay. There is no speaker plugged into the back (thru the same set of in-line filters as does the input DC power). The grounds from the same area are still connected to the side of the chasis and the power supply ground wire.

Nothing is happening...(RF output wise)...does anyone have any ideas????

I took the CAS, PTT, and Rx audio from the points that I was told to. I took the Tx audio from a pin in the upper left corner of the SAS board. I guessed on this based upon trying to trace the mike via the schematic. The only part of the schematic that I have is the SAS board.

If anyone can give me some suggestions/input, please email me @ n3ntj@erie.net

Kelly@panacom.com wrote:

>I am going for my tech license soon. I have the novice certifacte. I
>would like some advice on what type of radio I should get.

I have both Kenwood and Icom mobils. For a mobil I like the ICOM better. I recently bought the new dual band, the IC207H, and that is a very nice unit, around $400. For a 2 meter only rig I really like the IC-2000H from Icom.

As far as a handheld goes, I am really impressed with the new Kenwood TH-235. The high power 5 watt version with battery and charger is only $199

Good luck with whatever you choose

Hello I have the following for sale:

1) Kenwood TL-922a amplifier. Beautiful condition. Full output. I have
the original box, manual, service manual. Has the 10 meter mod.
Non smoker
Asking $1,100 or offers.

2) Kenwood TS-120s H.F. transceiver. excellent condition, works great.
Has the large mobile bracket, hand mic, and power cord.
Asking $350 or offers.

3) Gap Titan Dx antenna 80-10 meters vertical. Antenna is 4 months old
and is still on its ground mount. Put up another tower and wife says it
has to go to make some room. Excellent antenna, perfect condition. I hate
to get rid of it. I will take it down and box up to ship.
Asking $250

Thanks for reading my post

The answer to your dilemma lies in using a good tuner. Fortunately they can be had fairly cheap. Your will at least be able to match whatever you put on the car and transfer power to it efficiently. However what happens to that power (whether it goes into heat or into signal) is dependent upon the antenna itself. You've already constrained yourself out of any possibility of a GOOD signal, so you will have to settle for poor to mediocre. however, you won't see a lot of difference in receive abilities. It should also help a lot to get a really good bond from the end of the coax shield braid to the most massive, close by portion of the frame. I use a wide sheet of aluminum (about 6" wide) to connect the antenna mount to the point where the bumper fastens to the frame.

Just make sure you have a good tuner and learn how to use it to make your paper clip antenna take all you can give it, and leave the rest in the good hands of the propagation gods.

I hope you get some answers from some of the more knowledgeable
people, but here are my thoughts. The 4:1 balun that you describe
will do just fine for 200 to 50 ohms - if you are at a frequency that
is not outside of your baluns range of operation. If you go too high
or too low in frequency, the balun will no longer act like the
transformer it is supposed to be. If possible, make measurements with
an RF Noise Bridge or an SWR Analyzer to see exactly what it does to a
200 ohm resistor at your intended frequency of operation. While
you're at it, measure the antenna itself, if you can reach up that
high, and see if it's really what you think it is. That's not
entirely facetious, because if you can't get up to it, build yourself
a 1/2 wavelength section of balanced line, and use it to extend your
reach. Of course, figure out how you are going to make such
measurements using unbalanced devices to measure balanced loads.
Mayble you will have to trust the 1:1 balun for that. Oh well, it is
going to be somewhat of an education, even if it doesn't work - right?

Let's face it - you had better start being very creative and
inquisitive,.

>mods please post them to the newsgroup.

Steve,

I gave you these mods once before.

1. Make a photo copy of your MARS license.

2. Pack the radio for shipment.

3. Return the radio to Yaesu for a new EProm.

4. Wait for Yaesu to return the radio.

Isn't that easy. Sorry no secret diodes or solder blobs you need the
EProm.

From: Peter Shintani <shintani@tv.sony.co.jp>
Message-ID: <5tbq4e$pjj@oskgw.osk.sony.co.jp>
Source record: 167748

Thanks in advance.
I am looking for any information on the exact frequency
response for the HPF block in the Icom IC-706.
I think I may have damaged either the HPF block or
the main PCB when I was mod'ing by IC-706.
I built a jig to test the HPF block,but I don't get
the exact same response as written in the service manual.
Does anyone know if the HPF block's various filter
response actually have an upper cut-off frequency as
stated in the service manual ?
H6, TH, and H5 are pretty close
H2, H3 and H4's upper cut off's are all around 40 MHz.
Is that correct ?
Sincerely
Embarassed

4041. KISS and Baycom

Newsgroup: rec.radio.amateur.equipment

Message-ID: <5tc31b$7le@mogan.cc.metu.edu.tr>
Source record: 167749

Hi ,

I want to learn something about the operational differences between KISS TNC and Baycom modem .. I know that TNC includes a modem , a processor (probably Z80) and an EPROM . If we have modem but we don't have any TNC can the software on the computer emulate the transfer between the TNC and computer by using the modem ? Or are the 2 things (i.e communication between the computer and modem AND communication between the computer and TNC) completely different 2 mechanisms ? if they are completely different mmechanisms how does computer communicate with the TNC and how does it communicate with the modem ? if they are not different machanisms does any software exist to emulate the communication of TNC and computer in the absence of TNC (i.e in the presence of Baycom modem) ..
If anyone knows any documents about this subject and sends these or their places on the Web to my e-mail address I would be very appreciated ..
Thanks in advance ..

<frederick.mckenzie-1-1808971831180001@k4dii.ksc.nasa.gov>...
...snip
> I would expect that the higher current/lower voltage would lower its
> maximum power handling capability, due to saturation of a ferrite core.
...snip

I don't know why people seem to assume that all Baluns have ferrite cores. The Van Gorden 1:1 and 4:1 Baluns in use at this QTH are air core. I.e., they are wound on what looks like PVC pipe sections with holes drilled in them for the enameled wire windings. The winding with a UHF connector at one end and connections to lugs at the other end is all encased in another PVC pipe with a cap and eye at the top. They seem to work very well.

However, look at the literature in the ARRL Antenna books and study over what is said about "voltage" Baluns vs. "Current" Baluns. It's easy to mis-apply the "Voltage" Balun in a situation where a "Current" or "Choke" Balun is preferable. The original question is discussed very well on page 25-17 of the ARRL Antenna Handbook, 17th Edition.

Voltage Baluns suffer two problems in real-world antennas. Any unbalance of the the currents flowing in the two sides of the "balanced" side of the system will cause current on the outer shield of the coax side of the system (undesirable). Furthermore, the low frequency response of a voltage Balun can be a problem due to insufficient shunt impedance at low frequencies (this is where the toroidal ferrite will help).

For the application described in the original question, the "Current" or "Choke" Balun is called for. If a ferrite core is to be used, it should be two separate cores as shown on page 26-11, Figure 14 (D). If you prefer an air core Balun instead, then use a piece of coax of approximately 1/8 wavelength at the lowest frequency of operation coil it into a loop of about 8 turns. Tape it up and hang it at the antenna feedpoint. See page 26-12, Figure 15 (A) and Table 1.

In my opinion the original questioner should be concerned about whether or not the Balun he wants to use is designed for the frequency at which he intends to operate, because outside of the designed frequency range, all bets are off.

I'm a new ham (kf4trd) and am trying to assemble a descent rig for HF. I have a question about antenna tuners.

If I have a 40 meter dipole on my roof, and an antenna tuner between my tranceiver and the antenna, can I work 80 meters and 20 meters by tuning the antenna? If it matters, the rig is a kenwood ts-830s.

Thanks for the info!

If the repair job lasts 30 days, it's probably good to go for the long haul. That seems to be about your only reasonable option. The repair cost may not run as much as estimated since a "light" strike sometimes only takes out a device or two, usually voltage regultors first. If you see damage inside and smell smoke look for costs to be higher than if not. Note that often a 'lightning strike' doesn't hit your antenna at all, but a nearby object or the ground and the damage in the rig is from induced high voltage on the antennas/feedlines/powerlines-they act as a transformer secondary for a brief instant, long enough to trash your rig. For lightning protection I have my feedlines and rotor cables broken with splices outside near the house-when I leave home or observe a storm approaching, I can unhook the entire house from the most obvious lightning source, my antennas/tower. I then toss the cable ends out in tht yard several feet from the house. Also I plug all eqpt. into an ac strip which powers up the entire station from one plug (except the amp which is plugged into a 220ac outlet in the shack when it is used & unpluged when not). This keeps lightning induced line surges out of the gear. I've done all this for years with success so far. Of course none of this helps your present case a bit but for me it is the result of years of work cleaning up lightning damage in public safety and radio broadcasting eqpt. As far as I can tell it's the best I can do for lightning prevention in the hamshack. Of course it doesn't help a bit if I forget to unplug all of it!
73 & gud luck with the repair, Dick W0EX

This really sounds like you've tried to earn a degree and failed.

So why will no faculty grant you a degree under any circumstances?

-snip-
> I would ask you to consider if perhaps this could actually

HOW? Requiring all schools to issue degrees to those who have paid a
fixed fee (and quite possibly done nothing else) makes the degrees
issued
worthless.

How does this improve education? It doesn't. All it does is force all of
society to figure out some other way of determining whether someone is
or is not qualified to perform a job.

Hello...

I found out that my SAS board on my GE MVP UHF is bad. A guy locally who has used one on his 2m repeater checked my rig out and that was his overview. The 10V regulator isn't working and there may be something else not working on that board as well. It may be simpler if I can just find another SAS board for the rig than to try to diagnose what else may be goofed up. Do you know of anyone with an extra MVP or a scrap MVP with a good SAS board? That is the avenue I may need to take.. If possible, pass the word around for me..I'll be searching high and low for one. I think the SAS board can be from any MVP...either 6m, 2m, or 440MHz.

Thx and 73 de N3NTJ

OK Guys perhaps I was having a bad hair day. At 07:30 on Sunday morning these guys were setting up in the rain ro do this test. The contestants busied themselves retuning antennas that had been tweeked in the dry. Except for the screwdrivers the antennas were, as the English say purpose built for 75 meters.

OK here's the deal. If we organize a nation wide shoot out here in NM I will make it my business to investigate other bands. If folks want to play then I will work on getting a range for the higher bands. BTW one station here in NM did copy a number of the stations more data on that will be provided as soon as we can sort it out. Please be patient on this also most of us have real work we have to do first.

Jerry

Hi Jim,
I have a CTE (made in Italy) transverter that you can drive with a cb
and which covers 6.5-7.5Mhz with around 15-20w output, all mode of
course.
These units are hard to find but reasonably priced.

Marc,
I've been operating HF mobile for nearly 35 years and have had nearly every kind of antenna imaginable.
I now have been using a Wide Band, broadband, low profile, extremely rugged, Outbacker Perth!
Now 301 countries worked mobile under 100 Watts!
Need I say more?
Actually, this antenna is obviously NOT for everyone, especially those guys that want to run 2KW and work europe on 80 meters from the car, HA, but it is certianly worth looking in to.

...
>This was our first amp into the QRO mobile world about a year ago. Some
>have said it's too smart for its own good (it's called the Smart Cube)
>what with all its protection circuits.

Have used one mobile, portable, and as main station backup for nearly 3 years, and highly recommend the SG-500 for quality of construction, conservative design, and overall reliability. It does require a good SWR match, and one that is constant; the movement of the top whip on my Bugcatcher when underway was enough to cause it to trip out. So use a stiffer whip, or secure the antenna well. Going thru underpasses can trip the sensitive SWR protect circuitry, as well. But one look at the inside construction quality was all I needed. Plus the thing is heavy - uses a die-cast type chassis and heat sink. It makes the MFJ-Ameritron look like a large sardine can.

I understand there may be factory mods available which further improve the amp in the rf-actuated switching (it uses no relay control cable to tcvr), and possibly other mods, but I've not shipped mine back yet. It worked very well at the beach with a large deep cycle marine battery and auto battery charger, and has served as backup for my 8877 amp on occasion at home. I get about 550 watts out under battery power, with up to 700 out when the engine is running (15 volts or so).

Good luck,
73,
John K4IQ

You have something screwed up in your wiring...the LED is for TX only..
NOT power on....if the light is on, and you arent keying the radio,
something is WRONG!!!! Did you check the radio out BEFORE making
the mods? I am suspicious that you didnt....

> I ran the 4 (CAS, TX audio, RX audio,
> and PTT) to the correct pins on the controller, and connected the

> I key up the radio's mike.

Again, that light should NOT be on UNTIL you key the TX....period...

> I cut the two traces on the SAS board, removed the antenna relay,

> area are still connected to the side of the chasis and the power supply
> ground wire.
>
> Nothing is happening...(RF output wise)...does anyone have any ideas????

You need to ALWAYS check a radio FIRST before doing any mods....
THEN carefully check the mods TWICE while doing them.....
If you have the manual and schematic, double check the config of the
radio and mods....you obviously have something wired wrong and I doubt
anyone on the net will be able to find it for you...

Chris

: Take a look inside a junk TV set. You will find a fistful of slugs
: and ferrite cores.

That would work fine if you'r e building HF gear like ham equipment. But
most of the slugs in the TV set are not made for VHF FM band. If you use
the slugs from IF cans, they have too low Q at VHF or higher freqs.

And it would be okay to use the slugs out of a TV tuner, but it's doubtful
that they have any nowadays.

BTW you're a shameless crossposter, it's wrong to post to so many
non-relevant newsgroups.

4079. TS-570D ATT mod!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-20 00:00:00 UTC
From: hopewell@ctg.net
Message-ID: <872086435.23828@dejanews.com>
Source record: 167626

Hi all,

I have discovered a very interesting and useful mod for the TS-570D. I found it when I opened the bottom of my TS-570D last night to try and find out where the mysterious red light was coming from. (Turns out there's a small board attached to the bottom board in the radio that has a small red LED on it -- it seems to stay on the whole time the radio is turned on -- anyone know what it's for? It's INSIDE the radio!!!!)

Anyway, back to the mod --

While I had the bottom of the radio uncovered, I noticed a small jumper plug near the back panel (on the main board) that was installed in one of two positions. It's marked "BC ATT" and the jumper plug was slipped on the "high" attenuation posts. With the radio tuned to a local AM station with an S-meter level of S9+10, I removed the jumper and placed it on the other set of posts. The signal went up to S9+40! I then tried flip-flopping it back and forth on several other signals. I tried WCBS in NYC (I live in Virginia) and it went from S8 to S9+10! I discovered the jumper mod increases the sensitivity in LW too -- best I can tell, all the way from 30 kHz up to about 1705 kHz.

I'd like to know how this affects the sensivity specs of the radio in the BC band -- Kenwood's specs claim it's something like 35 microvolts (yuck) from the factory, I guess to prevent receiver overload in the BC band. If someone from Kenwood reads this, I'd like to know if there are written specs for the sensitivity with the jumper in the other

position.

I thought other TS-570D (and probably TS-570S) owners out there
might
want to try this since it really improves BC band DXing!

73,

Meade, KA4RQB

I agree with this except that given the same length antennas with the same length mast under the coils, the one with a hat (reasonably high above the coil) and consequently somewhat less coil, will perform better......both theoretically and by measurement.

I have 3 Icom U16 uhf hand helds for sale.
These business band radios are fully user programmable form the keypad.
440-480mhz with Programmable CTCSS PL Encoder/Decoder built in.
250ea or 600 for all three. Radios come with battery,antenna and one uses
a
speaker microphone. Will ship anywhere in USA.
Contact Bri2294@aol.com

4086. VX-1R, how many memories?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-20 00:00:00 UTC
From: rotnappl@ix.netcom.com
Message-ID: <rotnappl-2008971014380001@nntp.ix.netcom.com>
Source record: 167633

I've had my VX-1R for 6 days now I like it alot. It is very tiny, the two Standard's 508 & 510 are nowhere near as small.

But I do have a bone to pick about the number of memories. They advertize 299, but you only have either 52 or 142.

At first when I read the manual I thought "oh they must mean 52 per bank", nope I read the "Note!" at the end of the section,

I quote...

"Note! Most bands share the same set of memory numbers (1,2,3,...) to simplify the storage process. For example, if a V-HAM channel is stored in Memory 1, Memory 1 is not available on any other band (ecept BC Band). So the total number of memories is 52 for Group 1 and 142 for Group 2 (plus 10 for the BD Band in both groups), not 52 or 142 per band."

humm now can some explain how that works out to 299?

Greg

Radio Shack Pro 2006 Scanner. This is the one to have, 400 memory channels, very fast scan rate, and very clean reciever.

This unit has been modified to recieve the full 800 mhz band, and also has had scan rate speed mod preformed.

Looks and functions like a brand new out of the box unit. Comes with a manual.

Gentlemen,
Recently I aquired 6 Motorola hand held UHF Business Radios which are
factory new in the boxes.
Make: Motorola MT-2100 Model: H01RDD9AN5A w/ Digital Display
After consulting with my local motorola dealership, I discovered that
these
models are for european use only due to the signaling design and the
software
for programming them is only common to Europe and not the USA.
I need to find a radio dealership,business, or private party who is
interested in purchasing these units for a discounted price.
Your immediate attention will be greatly appreciated.
These units exactly resemble the US version MTS2000
Thank You,
Brian Walek

From: Gary Sanders <nospam.gsanders@gte.net>
Message-ID: <5tflr2roi1@gte1.gte.net>
Source record: 167643

Does anyone have an Astron RS-20 schematic they could
scan and e-mail to me?

I've managed to lose the manual that (I think) had
the schematic in it, and the power supply is zapped.

By the way, anyone have any idea what the problem might
be? The supply has no output. I've lifted the
crowbar SCR to remove it from the circuit. No change.

There is about 24 or so volts DC across the big filter
cap. There's about 29 volts DC out of the diodes fed
from the other winding on the transformer. Since I
don't have a schematic, that's all the checking I've
done.

Can anyone help with a schematic and/or suggestions?

Thanks in advance.

HI Scott:

Sorry no schematic, but some info for you. I've blown the FET on my preamp
several times now, I talked to a factory service man and he says this has
been a common problem. He suggested to check the SWR because its stray RF
thats doing the damage. I also talked to the RF & ANT engineers here at
work and they felt that my 5/8 wave ant was too close to my 10m ant and was
coupling 10 m rf into the front end of the amp or the 5/8 is coupling to
the 10m and creating stray rf in the cab of my truck. I tested with a SWR
meter and found this was indeed happening with the 5/8 ant, but not with a
1/4 wave 2m ant in place. I will try this when I get my amp back AGAIN! I
also asked the factory tech about bypassing the preamp and helical filter
and he said he has never done this and didn't know off hand how to do it. ?

Hope this helps....

Humm-

This radio is tiny! How can they up the output to 5W, and be smaller?

Seems to me limitaions of battery energy capacity limit the power, also
how are the going to get rid of internal heat generated with a 5W power
output?

In article <5t883q$m8@camel2.mindspring.com>,
dddavis@atl.mindspring.com wrote:
>

I have several channels on the VX-1R allocated to store a UHF TX freq. to crossband back to the car to get on a local 2M repeater. I place the dual-band radio in the car to crossband ONE-WAY, because most of the time I can hear the local repeater, but I can't hear me. I set the car dual-bander up to receive the UHF simplex frequency 446.00 (with PL CTCSS on so every noise does not key up the crossband operation). Then I set it up on the 2M side for the repeater input frequency. I turn the car radio to 5 watts out and turn on the crossband to go UHF to VHF. The car radio only transmits when you are talking. And there you are, you don't have to wait until the squelch tail drops and you can join in with the best of them.

The text below is taken from the manual (page 32) on how to program the VX-1
****

Independent Tx-Rx Frequency Storage ("Odd Splits")

You may need to use a repeater that has a non-standard shift (an Offset that does not conform to the local repeater band plan). The VX-lR allows you to store the transmit and receive frequencies independently into a single memory; so you can store the non-standard repeater's settings without having to change the "standard" repeater shifts in your VX-1R (+/-600 khz, +/-5 MHz, etc.). The procedure is very simple:

1. Be sure the transceiver is in the VFO mode. Press [MV] once to change to VFO operation, if necessary.

2. Turn the Dial to the desired receive frequency. Then, as with "Simple Memory Storage" previously, set up all needed CTCSS/DCS tones and modes, but eliminate any repeater shift (+ or -icon) which might be set.

3. Hold [FW] for 1 second so the "F" icon blinks and a memory number appears above the frequency dis-play. The next step must be done within 5 seconds while "F" is blinking.

4. Turn the Dial to select the memory number to store the receive frequency, and press [FW] momentarily. Remember this memory number, as you will need to select it again below. -

5. Now turn the Dial to the desired transmit frequency. ** At this point change bands, if you have stored a 2m receive frequency, push the [BAND] until you get to UHF ham VFO mode and enter a simplex UHF freq. (446.000 or whatever, NO OFFSET) This process you can also store a 2m simplex TX

on a UHF repeater frequency.

6. Again hold [FW] for 1 second so the F icon blinks and a memory number appears, and turn the Dial to select the same memory you stored the receive frequency in, which will be blinking. The next step also must be done within 5 seconds while F is blinking.

7. Hold the [PTT] switch while pressing [FW] momentarily.

During memory storage, pressing the [PTT] switch does not cause transmission; rather, it signals the radio's microprocessor that a transmit frequency is being stored.

Memory storage is now complete. When you recall a memory containing independent Tx/Rx data per this section, you will notice that the repeater offset is shown as -+, indicating that the pre-programmed default offset is not in use.

Here is the information I have obtained from another helpfull ham, I
have not tried this mod yet. Hope it helps you.

Note that after performing the mod, ARS (Automatic Repeater
Offset) will not function (whether it's turned on or not), and you
will lose any stored memories and preferences.

The mod is very simple. First, put the piece of protective plastic back on the display, or take a 3M Post-It Note (tm), and stick it to the display. Work on top of a piece of 8 1/2 X 11 paper (good contrast, will also keep from marring the radio).

Open the radio by removing the 3 screws. Taking a small flat screwdriver, release the tab on the left, inside the battery compartment (assume radio is facing down, antenna away from you). Release the 2nd tab that's about halfway up the inside of the battery compartment. Being very careful, separate the 2 halves the radio. You'll need to apply a kind of rotation along with the separation. Note that the battery compartment lid and hinge pin will fall out. Keep track of these!

Immediately to the left of the rotary knob and next to the edge of the case, you'll see two pads, marked 0 (closer to the top) and 1 (below 0). They look like a gold circle with a line down the middle. You won't have to move the battery compartment sticker to see these. Each of these pads need to be bridged with a solder blod. Use a small iron, and work carefully, or you'll burn the case.

After bridging the pads, snap the radio back together. I had a slight amount of difficulty getting the right side of the case aligned, so you may have to work at it slightly. Before you actually perform the "snap", put the hinge pin through the battery compartment lid, and reinstalled the lid. Replace the 3 screws.

Add battery, antenna back to radio. Holding the M/V key and AR, apply power (this is the hard reset to the radio). When the menu that says "INI? F" appears, press the F/W key to reset the radio. You should now have the expanded mod. You will lose all the memories and preferences, so either record them, or do the mod before you save lots of frequencies.

My tests show that you can also now transmit from 108 to 137 (AIR), 137 to 170 (V-HAM), 170 to 222 (VHF-TV), 420 to 470 (U-HAM), and 470 to 580 (part of UHF-TV). I haven't measured power output, but am simply going on the fact of the TX LED lighting or not, and whether it made the speakers next to my PC buzz or not. Remember, it's not nice OR legal to transmit out of band, or outside your license class.

When tuning around, be sure to check the receive mode. The processor puts the radio into AM in places where it doesn't make any sense, so don't trust the RX-MODE option being in AUTO. I keep mine disabled.

Never had this problem- the radio has a better reciever than the other
HTs and FM mobile units that I own, including the Yaesu FT-8000,
FT-530, and my Alinco DJ-580s and the 582. The unit, however, is
NOT immune to intermod, but locally, I have only one incident to
report in which it adversely affected the radio- I was parked about
200 yards from some several hundred watt paging trasmitters. Then I
had some problems. After I drove about a half a mile away, the
intermod disappeared.

My friends and I have done a mod but it is risky. So proceed at your own risk!!

We opened up the radio, and put compressed "first aid" cotton, or hard sponge inside the power button (on the inside), to fill up the gap. Now the button is harder to push, and thus will reduce (but not eliminate) the accidental power on problem. This works quite okay for us as we know there can be no fix from Yaesu.

Another solution (but we haven't tried) is to put a piece of paper between the battery terminal and the radio if you do not want in on inside your backpack. Just remember to take it out before you think you have a dead battery. Kinda awkward.

Well, "Yaesu did it again!", remember Yaesu's motto. So I am not surprised about the "special" memory arrangement of the VX-1R, or the voice recorder function not as said in the manual etc.

Also, FT-10 series (single band ones) are much better in intermod rejection.

Fancy radio, but not as "serious". I think I still like Standard better.

>have a question about antenna tuners.
>
>If I have a 40 meter dipole on my roof, and an antenna tuner between my
>tranceiver and the antenna, can I work 80 meters and 20 meters by tuning
>the antenna? If it matters, the rig is a kenwood ts-830s.
>

Mike, You probably can work these other bands as long as the tuner will match the antenna to the rig. The thing you need to realize about antenna tuners though is all they do is make your transmitter happy. They do nothing to improve the signal once it gets to the antenna.

Your transmitter has a 50 ohm impedance and your antenna has an unknown impedance on these other bands. All the tuner is doing is "fooling" your transmitter into thinking it is a resonant antenna. What is actually happening, is you are using your feedline as part of the antenna at that point.

The thing you need to be careful of when using a tuner, is to remember that the feedline coming OUT of the tuner going outside is part of the antenna and you are likely within an arms reach of the feedpoint of your antenna and could get a nasty RF burn. You also have to be careful that you don't get any RF feedback into any other equipment.

Hopefully you can store in Tone Squelch, some bands like
UHF-TV, and VHF-TV, the radio will not you do it manually.

I listen out of band and get lots of intermod when I use
a long whip antenna.

Hopefully they see this and fix this bug with the ADMS-1D
software!!

I thought I might tap into the great minds that comprise this group. This afternoon I saw "The Lost World" ("Jurassic Park" sequel). In one scene one of the main characters dusts off an old transceiver and transmits a "CQ" to get assistance. Was just wondering if the actual rig used for filming was an amateur radio or what. It was very dusty so I could not make out a brand or model number. I do know that Yaesu rigs have been popular in movies lately with "That Darn Cat" first coming to mind.

Just a curiousity...

4122. News Rover -- Searches newsgroups for what you want - 218 0821030138 IVK

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-21 00:00:00 UTC
From: 376@RoverBase.com
Message-ID: <5tgssc$bva@news1.triton.net>
Source record: 167550

Automate your collecting research!

News Rover is the ideal tool for searching through Usenet newsgroups for messages about items that you collect. Once you tell it what to look for, News Rover will scan a set of newsgroups and collect all messages that contain what you are searching for. For example, if you are interested in messages related to slide rules or calculators, you could specify a search expression such as:

slide rule or calculator

News Rover will then scan a set of newsgroups you select and collect any messages that match the search expression. This searching is completely automatic, so it works while you sleep, work, or play. The search expressions can be as simple as a single word, or they can be complex expressions with AND, OR, NEAR, and NOT operators.

You can download a free demonstration copy of News Rover from:

http://www.NewsRover.com

But News Rover is good for more than just searching collectables newsgroups. You can use it to search for family names in genealogy newsgroups, or for any other type of information in any newsgroups you choose. And News Rover is ideal for picture newsgroups. It decodes both UUencoded and MIME base64 images, and it combines and reconstructs binary files that are split into multiple messages.

Here are some of the key features of News Rover:

o Scans newsgroups you specify while you sleep, work, and play.

o Automatically downloads messages and attached files so that they are available for instant access when you are ready to review them.

o Decodes attached files of all types (UUencoded and MIME base64).

o Displays a picture gallery of collected thumbnail size images.

o Selects messages based on include and/or exclude criteria to help you find a needle in a haystack and eliminate spam. You can even use complex selection expressions with AND, OR, NEAR and NOT.

o Supports multiple "interest groups," each with sets of newsgroups, selection expressions, message database, and picture gallery.

o Remembers files already extracted and eliminates duplicates automatically.

o Saves parts of multi-part files, searches for the missing parts, and rebuilds the entire file when the last part arrives. It even combines parts found on different days and in different newsgroups.

o Allows you to post Usenet messages and send e-mail messages.

o Allows you to block all future messages from specified senders.

o Operates on a schedule you set up to use your phone line only when you don't need it.

o Automatically dials the provider and hangs up the phone when it is finished.

o Works with almost all Internet providers and news servers.

o News Rover is multi-threaded so you can read messages and view pictures while it downloads and decodes more messages.

News Rover was designed and written by real-life Usnet newsgroup junkies! With News Rover the news is ready when you are!

To learn more and download your free demonstration copy, visit:

http://www.NewsRover.com

News Rover is getting rave reviews...

D.G. says: I downloaded News Rover last night... I ordered this morning. I don't know how much time I saved. I give your product two thumbs up!!!

T.B. says: "Great Job!!! I tried your software for the first time today, and it beats Plukit-32 hands down!!

Looking for another Icom 706 in excellent condition with original box
and manual. Please E-Mail with price and condition to
74364.207@CompuServe.com, you cannot use reply.

4125. Help buying first HF rig

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-21 00:00:00 UTC
From: Spam@spammers.com
Message-ID: <33fc471a.7486156@crc-news.doc.ca>
Source record: 167553

I'll be moving into a 1st floor apartment with a 4th floor flat roof (that I MIGHT be able to sneak a small antenna on to.)

For ~$1000 canadian, is it possible to get a good HF rig that would work under these conditions? I don't mind transmitting with a "temporary" set up that I have to take down every time I'm finished. I do have access to about 30' on the front yard (I've run a long wire from my SW radio out the living room window many times.)

I've been VHF/UHF for about 4 years now, and am just aching to get on HF, but noone I know is active.

Help!

VA3-SID in Ottawa, Canada

4126. FS Kenwood TS850S/AT MC60 Mike

Does anyone know how to connect a pl to the Palomar RBC730 repeater controller? We need to "pl" link 2, the manual does not show where to connect, nor how to toggle the pl on / off. Our sources say that the mfgr. is out of business. Telephone calls to numbers referenced in the manual have been in vain. Tks in advance.

The answer is 'Dripless Oil'.

Specifics: 3.4 FL. Oz/100ml, Blue bottle with flip top
spout.

Claim on back:Dripless oil reaches hart-to-get-at places
because it runs-in like a rapid penetrant, then the special
carrier evaporates leaving a dripless long-wearing film that
won't drip out.....

Manufacturer:
AGS Company,
Muskegon, MI USA 49443

---------- Personal Experience----------

The oil is thinner than any other I have found.

Just 2 or 3 drops on a VERY STUCK aluminum antenna pair
was easily separated by hand. I was actually amazed.

Two of us had used Clamping devices and were unable to
remove the stuck antenna sections. I damaged one section
before I decided to get more gentle.

I place about 3 drops along the telescoping seam and the
oil dribbled down into the joint. I waited about 10 seconds
and easily separated the parts, all by myself, without tools!

I have no affiliation with the company and get nothing
for this post. In Fact -- try other thin oils if
you want! But they gotta be very thin.

I think you can get this oil at Longs or Homebase stores too.

Has anynbody ever seen or heard of a commercially sold sideswipper key?
They were also known as "cootie" keys way back prior to WW2. I had
one made out of a hacksaw blade and bakelite handles on the end that
I used from 1937 till about 1950 in the Army Signal Corps and then later
in Airlines as a RO. I seem to remember that there was a US Govt
issued USN Sideswipper that I saw just before WW2 in QST "surplus"
sales outfit but wonder if the USN ever did have a gov issue one.
Not important but just wondered!!

Giovanni,
This sounds like the problem with plastic trimmer caps in the PLL section. It usually starts on one range and is sensitive to humidity changes. The solution is to replace the plastic trimmer caps with ceramics and re-align the PLL. This problem appears on many Icom models from that vintage. Try a phone call to Icom service, they may supply the caps without charge.

Good luck, Greg K3EWZ

Hi Mike, Yes, you should be able to work 80 meters and 20 meters (and probably other bands) using a 40m dipole and an antenna tuner. The impedance of your antenna may be very different from 50 ohms at these frequencies, but if your tuner will allow you to tune up, you're in business. One caveat: depending on the antenna impedance, there may be a very high SWR on the transmission line. If you use coax between the tuner and the antenna, there are additional losses on the coax under conditions of high SWR. These losses can range from less than a dB or so to more than 5 dB (see QST 12/93 p.70), so you won't make too many contacts if you work QRP. On the positive side, it's been pretty well established that all your transmitter power (minus any losses in the transmission line and tuner) is radiated. See any of the discussions by Walt Maxwell W2DU (e.g., QST 3/85 p.45 or the book Reflections). 73 es GL, Bill N3WK

That's a difficult trade off to make and depends on the type of operating
you do. With a Hustler/Hamstick equivalent antenna I can work several folks
in the local 75 meter morning group who live in rural areas with low noise
levels. It also helps considerably that they are 100 to 130 miles away and
fall in the typical maximum strenght skip zone for 75 meter mobiles. The
other guys, only 10 to 40 miles away who live in the city, like most of us,
have a very difficult time. Interestingly, I have trouble copying them
unless they run at least 1kW. When I switch to a bugcatcher, I can't hear
any better but get (apparantly :-)) fewer complaints; a few dB is an enormous
improvement when the QSB is low and the signals are at the detection threshold
of the human ear. I've recently added an amplifier in the mobile which
gives another eight or nine dB and now I seem to be able to participate as if
I was a typical fixed station. If i'm anywhere near power lines or in an
urban area, the fixed stations really need to run 1kW. It's interesting
that successful operation requires power on both ends but for slightly different
reasons.

>>> I'd like to see some of the "shoot-outs" done at 40 and 20 meters
>>> instead of just 75 meters. I agree the ham-stick type of antennas
>can't
>>> compare to a bug catcher on 75 meters. It would be nice to have some
>>> real tests on how they compare on the other bands for those whos
>primary
>>> interest is not 75 meters.

That could easily be done. The original goal of the shootouts done the last
several years in California was to evaluate the 75m DX potential of various
mobile antennas. Several of the hams were trying, with considerable success,
to work DX during the early morning openings to asia. The shootouts provided
a very convincing validation of the applicable antenna theory, which has been
known for years. I would like to extend it to 160 meters since it's even harder

to do well but there seems little interest out here on the west coast. The higher bands are less critical because the antennas are considerably more efficient and the propagation can be more forgiving unless you're trying to deal with a pileup.

>Historically 75 has been the band of choice for local HF mobile work.
>With the exception of 160 it is also the most difficult to do mobile.
>
>These are the reasons the various shoot out groups do their testing on
>75. If you guys want to do a shoot out on other bands build the field
>strength meters and have at it but don't criticize those that actually
>do something because they don't do just what you want them to do.

I'm happy to work with anybody who has an interest in making accurate HF mobile antenna measurements. Be warned, it's more difficult to measure patterns on the higher frequencies due to the weaker groundwave and greater dependency of the pattern on height. The two low bands are by far the easiest to get meaningful measurements. Ten meters is essentially VHF and requires considerable care in site selection and instrument construction. And that's after you decide exactly what it is you are going to measure.

>> comparison on 75 meters doesn't necessarily apply to all the other
>> bands.

What's good for 75 is good for 160 and in most cases, 40 but the other bands are a little different problem. Mounting and construction difficulties are similar however.

>I also respect all the work these guys put into the "SHOOTOUTS". It
>helps all of us make informed decisions on mobile antenna purchases.

That's the primary reason we do it. HF mobile has become so easy these days with the excellent compact transcievers now available. Unfortunately, many seem to think HF antenna systems have also become compact! Not true but the availability of 12 volt operated power amplifiers can go a long way to making up the difference. Come to one and see for yourself how other hams have solved the various mounting, electrical and construction problems. You will leave with a good understanding of what it's going to take and where you can, and where you shouldn't compromise.

When guns are outlawed only outlaws will have guns, when scanners are
outlawed only the outlaws will have scanners! Anyone read 1984
lately???? Make certain we continue to invite uncle Sam into our
hobbies. For our own good, we should make very sure the public hears
only what UNC wants us to hear! IF i'm pro anything it's the right to do
as I please without harming others! BTW any piece of gear that comes
into this house is receives all mods that do not degrade performance. I
have no problem with those who feel that open scanners are a BAD thing.
I only have a problem with them wanting to enforce thier beliefs on me!

I value my freedom! stan

John, I have the EZ Clone software and cable for the KW TM-V7A. It works okay. I wish it did a little more. I did not know they were out of business. I will have to check their web site: http://www.acsys.com. Update: I went to their web site and it does not make mention of the EZ Clone software.

Well said Sergeant. Your problem is not confined to just your area. The incidents of interference in police frequencies by either hams, or bootleggers, with modified equipment has become a national problem.

Hams had better wake up or they will find themselves in the same plight as gun owners. Big Uncle Sam is going to step in and take away their "rights" and toys if they don't start regulating themselves, especially if it comes down to cops calling for tougher regulation. The cop unions are bigger and richer by light years than the ARRL, so politicians will listen to them.

Thank you for having the decency, integrity, and willingness to tell our friend to prove his need and then obtain the modifications from the proper source.

Patrick

The new catalogs are here. New scanners including a "Trunk Tracker". No cost but you are limited to one per customer (sales receipt, part # is 68-1998).

Also new catalog "TECH America". Lots of parts, test equipment, scanners and Standard amateur gear. At Radio Shack, $2.95 but get $3 back on first order. If you call (800-877-0072) or use their web page (www.techam.com), it is free. Operators are very helpful.

I wouldn't expect many stores will permit you to return packaged
software for a full refund. They'll replace the defective disks or CD
ROM. If they're real nice they'll let you select something else.

If they gave refunds, many would buy the software, load it on their
computer and return it for a refund (unless it needs the CD ROM to run).

4162. trade for bc9000

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-22 00:00:00 UTC
From: Nick Marsh <nickwb4sqi@wwd.net>
Message-ID: <33FDE7E1.2853@wwd.net>
Source record: 167460

Looking for a BC 9000 scanner.

Items to Trade:

HTX-100, 26 - 30 mhz, 45 watts pep, usb/cw, manual and power cord.

Uniden HR-2510, 26 - 30 mhz, 35 watts pep, usb/lsb/AM/AM/CW, manual,
bracket and power cord.

Galaxy DX-55V - 240 channels, AM/FM, large meter, bracket, manual, power
cord, mint (brand new).

Browning Eagle R-27 receiver, S-23 trasmitter, SAM's schematic,
Realistic desk top power mic, needs transceive cable.

Cherokee AH-27 handheld, 240 channels, like new with manual.

I'll trade some combination of the above radios to a bc9000 or PRO2006.

Apparently you have not read Steph's post carefully. She has said nothing about banning modified radio's she has only stated that she is not going to give out the information to just anyone. If they want the information then go to the proper source with proof that they are legally entitled to own a piece of equipment with the modification.

Stephanie has demonstrated an extremely high degree of ethics here. She obeys the law even when no one is looking.

Do as you like, but remember that for each decision we make there will be a consequence.

>match the antenna to the rig. The thing you need to realize about
>antenna tuners though is all they do is make your transmitter happy.
>They do nothing to improve the signal once it gets to the antenna.

Except of course to allow your transmitter's power to be effectively
coupled to the antenna, and to maximize current flow on the antenna.
That's pretty important, and is a bit more than just making the transmitter
happy, though that's an inevitable consequence of the matching. The tuner
and transmission line act as cascaded impedance transformers coupling
between the rig and the antenna.

>Your transmitter has a 50 ohm impedance and your antenna has an unknown
>impedance on these other bands. All the tuner is doing is "fooling" your
>transmitter into thinking it is a resonant antenna. What is actually
>happening, is you are using your feedline as part of the antenna at that
>point.

No, you are not. The feedline is still a feedline, and the antenna is still the
antenna. The feedline will not act as a radiator unless it carries *common
mode currents*, and that's a function of the design of the feedline and
antenna. The tuner has nothing to do with that.

In this case, the antenna is balanced, so if you use balanced feedline, there
will be no common mode currents. If you use coax, you need a balun, but
you needed that on 40m too to avoid common mode currents on the feedline
in that band, even if you used no tuner at all.

The idea that a tuner just "fools" the rig is a dangerous misconception.
The tuner *does* "tune" the antenna after a fashion. Remember that
a feedline with SWR is a transformer, and that transformers work in both
directions. If the tuner is adjusted for a *conjugate match* with the antenna,
a reactance will be coupled from the tuner to the antenna feedpoint by that
transformer which will be of exactly the correct value to cancel any reactance
of the antenna. This will allow the maximum current possible for that length

antenna driven at that power level to flow, and gives you maximum radiation from the antenna.

The only real difference between using the shack mounted tuner and a network at the antenna to achieve resonance is that the former will suffer some extra feedline loss due to SWR. Using ladder line will make that loss insignificant at HF. Using coax, the loss could be considerable at some frequencies, IE using the 40m wire on 20m where its feedpoint resistance will be very high, and consequently the feedline SWR will be very high too. That can be a matter of concern, and is a good reason to prefer ladder line for this sort of antenna.

>The thing you need to be careful of when using a tuner, is to remember
>that the feedline coming OUT of the tuner going outside is part of the
>antenna and you are likely within an arms reach of the feedpoint of your
>antenna and could get a nasty RF burn. You also have to be careful that
>you don't get any RF feedback into any other equipment.

Again, the tuner has nothing to do with this. It is purely a matter of the antenna's design and the way the feedline is coupled to the antenna whether the feedline will be "hot" or not. Keep it balanced, and you won't have a hot shack. Unbalance the antenna system, and you'll have a hot shack, tuner or no tuner, and no matter what band you use.

And someone is bound to natter on about grounding the rig, or using a counterpoise wire on it. That's a bandaid to mask the symptoms of an unbalanced antenna system. You shouldn't be using a bandaid to cover a cancer. Fix the problem! If you maintain system balance, the only reason you need to ground the rig is ordinary electrical safety, and the third wire in the power cord does an adequate job of that (though for *lightning* protection, you'll want to take further steps).

Now if you were feeding a *long wire*, or some other inherently *unbalanced antenna*, you'd need that RF ground or counterpoise at the rig. But you don't need it for a balanced flattop fed in a balanced manner by either open wire line or coax with a balun at the antenna feedpoint.

The big thing you have to worry about when using a flattop antenna system like this is whether the impedance presented by the antenna at some frequency will be so extreme that the cascaded transformers of the feedline and the tuner won't be able to conjugate match it. In those cases, you can adjust the length of the transmission line to obtain a different matching range more suited to the presented impedance. (The transformer ratio of a transmission line depends on *both* the SWR on the line and the *length* of the line. See the Smith chart.)

I agree with you about the wrongfulness of issuing degrees, simply because someone paid their tuition. However, I've met many people that did the work and earned their degrees, but were not as qualified as someone without a degree. Having a degree does not make a person the best one for a job. This is an unfortunate discrimination.

Gentlemen,

I must step back into this discussion at this point. No where in my comments will you find any recommendation for government interference in our lives. Nor will you find any recommendations for government bans on anything....especially the ability to recieve anything on the airwaves. This has nothing to do with banning guns and that point is totally out of place being brought into this discussion. I am a civil libertarian and believe that the best control is self control, period.
My point is simply this, amateurs need to police themselves or the government will do it for us. Modified radios are causing trouble nationwide and the emergency communications community is starting to get riled up about it. This was driven home to me personally by the recent events I talked of in my earlier post. The FCC is largely useless anymore for dealing with these problems as they claim to have no staff. They want local agencies to solve the problems themselves. I can assure you that the amateur community will not like the local solutions to these problems, let alone the bad relationships they foster. Also, in the worse case senario, what good can the FCC do (assuming they do anything)to deal with an ems person who is injured or killed because of malicious interference, or to bring it home, how would you feel if your call for ems assistance was delayed or prevented because of malicious interference? I continue to maintain that there is no reason to open the transmit up on a radio that can already recieve ems frequencies from the factory....except for a person that has the intent to illegally intrude on those frequencies, or a person that just has not thought this action through. This is not a point that can be rationally argued....transmit mods = illegal transmissions.
I hope this clears up any misunderstandings about my earlier post.

--

I have recently acuired my tecnician license and am ready to
purchase a radio. I want a dual band mobile and am considering the
Yaesu FT-8100R or the Kenwwod TM-V7A. I am looking for advice on these
two radios or any radios that anyone has had good luck with. Pros and
cons would be good. I like the wide recieve on the 8100 and am leaning
towards that. Thanks for any advice.

So I have read about the rx/tx mod to the FT-50 that requires
unsoldering a certain miniscule resistor under the keypad... is
there any reason one could not simply *cut* this resistor, which seems
like it would accomplish the same thing from an electrical standpoint,
without risking burning a fist-sized hole in your HT with your handy
dandy plumbing grade k-mart soldering gun?

Jim, If you pick up a "Radio Tech Modification Manual" from Artsci, It shows how inserting two transistors (Q12 and Q16) will open up 800 Mhz receive as well.

The page also says that you must power up the unit as follows after removing D15:

Press and hold [B] & [#] while turning the power on.

Hope that works!

My motorbike-radio (not available anymore) has the following defect:
1) By turning the radio on, the speakers sounds a loud 'plop'-sound
and
2) the volume doesn't sound so loud as it use to be.

Everything else is funcioning normal.

Who can tell me what part is defect, if I can repair it and what it
will cost me ?

The radio is good servicable (modulair) and about 12 years old.
I can't replace it because it also regulates my on board
intercom-system.

Thanks for your reply.

Gentlemen,
Recently I aquired 6 Motorola hand held UHF Business Radios which are
factory new in the boxes.
Make: Motorola MT-2100 Model: H01RDD9AN5A
After consulting with my local motorola dealership, I discovered that
these
models are for european use only due to the signaling design and the
software
for programming them is only common to Europe and not the USA.
I need to find a radio dealership,business, or private party who is
interested in purchasing these units for a discounted price.
These radios exactly resemble the US version MTS2000..
Thank You,
Brian Walek

It never has been and never will be. The FCC dont care if its a ham
or nonham that is interfering with other services, especially PSB,
with modified or otherwise radios. If a person is stupid enough to
mess with PSB they WILL get caught.

To be honest, I think VE teams taking bribes is a far worse problem
than modified radios ever would, or will be.

>
>>
>" I made the assumption because I happen to own a FT-8100 and the
>only mods available for it are to extend the transmit frequencies on

>cellular and no mods are available to restore that.

There is nothing wrong with modifying a radio for extended trasmit. It
generally increases the value of the unit for the owner, and the
versatility of such a device. Apparently your thoughts is that hams
should be entrapped to non frequency agile radios. Gee, mabye we
should make homebrew equipment illegal too?

>
>It is also a fact that several of our local police agencies including my

>example of humanity kept keying up on top of his calls for help.

The police department should call the FCC- I literally have seen them
come the VERY NEXT DAY after a complaint, it just happened here
locally.

>Sorry if I lack understanding but I know of a number of individuals
>in my immediate area that are in possession of modified radios and
>while they are not behaving as this person is, several of them have
>made "accidental" transmissions on our police frequencies when they
>did not check which band they were on before making a call.

I have several radios that are modified to xmit out of band- when
monitoring public service frequencies, I glue the offsets so that if I
do transmit, the rig ends up transmitting within the 2 meter or 440
band that is allocated to amateurs- in this method, if I accidentally
transmit, it ends up doing so in a legal area, or if someone else
messes with my equipment, they'll do much less damage if they transmit
with it.

>
>I can not control or be responsible for the actions of others but I
>can damn sure try and discourage any further unnecessary
>proliferation of modified radios. Yaesu does not authorize any
>modifications to it's radios except as authorized by membership in
>MARS/CAPS. This is to prevent just such problems as I have covered in
>the previous paragraph. This is not a game, it is a matter of safety,
>and at times, life and death.

Thats why the services should call/contact the FCC. Although the FCC
pays much less attention to amateur and CB traffic, they easily crack
down on people interuppting the operation of emergency services.

Although rather brisk, Bill, I do agree with your opinion. I really
dont't think your attitude is bad, its just direct and to the point,
and apparently some people dont understand that.

Ms. Stephanie does have a point about interference with emergency
services, and how it is bad- but the "lets ban/restrict stuff"
approach that she had presented is simply not feasible.

Hmm, can I come over and restrict your transmitter to .0000001 watt?
How about if I put a camera that you must carry over your shoulder
that watches you while you operate your radio?

This whole argument is EXACTLY akin to GUN CONTROL- cept the guns in
this case are RADIOS.

People dont seem to GET THE PICTURE that unless all radios could be
destroyed (virtual impossibility) that SOMEONE if they want to, badly
enough, will get their hands on a transmitter, that will operate on a
given frequency.

Why don't we worry about things that CAN BE CONTROLLED for a change
(like diseases or something, or poverty, or maybe welfare reform, or
something similar)
instead of whining about wars that were already lost ages ago.

-Mike

Hello, I am in need of moola for my VHF and higher class hobby.
I have a Drake TR 7 in mint condition for sale. Best offer will get
this excellant rig + the P/S. I am looking for around $700 or the
highest bid that comes in. Willing to dicker so if any one has any
trades- give it a try. I work days so calls after 6pm and before 5am
should be the best time to try to call.
Mike ,
aka KC7KEM
PS. I am using a fellow hams account so please call ,

4195. Icom A3 or A22 external mic and PTT wiring please.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-22 00:00:00 UTC
From: Keith Pickersgill <keithp@iafrica.com>
Message-ID: <01bcaeda$f3dbc0a0$46531fc4@p200>
Source record: 167595

I am trying to build a microphone, PTT and speakers into a helmet to use on an
Icom A3 or A22 airband radio.

Does anyone know how to wire the mic and PTT ?

I tried all the systems that work on the Icom Ham handhelds, but this seems to be a different design.

It seems I need an external switching transister and a couple of resisters.

Please reply direct to my email, keithp@iafrica.com, as I do not read this newsgroup often.

Many thanks for any help.

> Good luck, Greg K3EWZ

I believe ICOM charges about $11.00 for a set of caps. Replacing the
caps involves removing the PLL shields from the PC board - a big job.

I really like my Standard C510A. It has the power I need for proper communication, the scanning ability of both VHF and UHF in the same bank and good intermod rejection.

Best of all this small radio works well on my direction finding equipment. Most receivers don't work well with my Micro Finder doppler or Super DF time of arrival transmitter direction finder.

The next best thing are the batteries...3 AA standard batteries. During normal use, I use rechargable Nicad's, but during an important event, when I forget to charge my batteries, I throw in alkaline's.

4206. Alinco DJ-S11 Modification

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-23 00:00:00 UTC
From: nobody@REPLAY.COM
Message-ID: <199708231845.UAA26284@basement.replay.com>
Source record: 167409

I just preformed this same modification on the DJ-S11 and now have it RX/TX
from 135 - 174 mhz

Subject: EXPANDED RX / TX MOD FOR ALINCO DJ-S41

Performing this modification will void any warranties.
All standard disclaimers apply. This mod is for the
DJ-S41T, and not the DJ-S41(C) 10 mW version.

1. Place the radio face down on a soft towel. This avoids
scratching the display and gives you a place to put
the seven tiny screws to be removed.

2. Remove the batteries.

3. Remove the three screws on the upper rear cover, and
the four screws inside the battery compartment. The
rear cover can be lifted and removed easily, as there
are no wires to be concerned about. The antenna
connection is made by means of a gold-plated spring
contact.

4. Look for a small (about 1 mm) green surface mount
resistor (actually a 0 ohm jumper), located on the far
left side of the exposed circuit board, located to the
"northwest" of the speaker. There is a marking in white
letters, OP/CL, this resistor is over the top of the "P".
It is the only green component visible on the board.
(This radio does not have the traditional Alinco red
and blue wires which have become so familiar...)

5. Carefully remove this resistor, using a small tip soldering
iron, tweezers and a steady hand.

6. Re-assemble the radio, being careful that the thin rubber
gasket is seated around the inside edge of the rear cover.
Replace the batteries, press and hold the "F" button on the
left side of the radio, and turn it on. The display should
show all segments and markings. Release the "F" button and
the radio will now be capable of operating from approximately
425 MHz to above 470 MHz, depending on the VCO's tuning.
The display will blink if the VCO is taken out of its range.
Re-tweeking of the VCO is not recommended.

THE NOT-SO-FINE PRINT:

7. Although reception on the expanded frequencies is legal,
transmission is not. This unit is not FCC type-accepted
for anything but ham band (425 - 440.995 MHz) operation.

Source record: 167412
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna

To clarify the points made:

1) Safety belts are NOT and WILL NOT be illegal, they are to be used as positioning devices and NOT as fall protection devices. A safety belt is needed to work on a tower so you can strap in and lean back so both hands are available for work.

2) A fall protection device is always desirable IN ADDITION to a positioning belt (and is REQUIRED by OSHA for commercial work starting in 1998). A fall protection device is a harness you wear around your body with "D" hooks on the back, which is attached to a secure point above you with a line. This line is normally loose and only comes into play if you were to fall.

Message-ID: <33FF543F.BA878247@erie.net>
Source record: 167414

Hi ...

I found a new SAS board and put it in the MVP, and it still doesn't work. The tx LED is on when the power is turned on, but goes to full intensity brightness when the PTT is keyed. There is no RF output as well.
I don't have any manuals on the radio and am out of ideas. I may have to try to find another UHF radio. I am not getting anywhere on this project. :-(
I don't know where there should be what voltages. Across the voltage regulator, there is more than +10V. Same thing with the other SAS board.
If you have any ideas, please let me know.
Know of anyone with an inexpensive GE Master II Exec or MVP or something I can use?

Message-ID: <33FFA2C2.282A@ix.netcom.com>
Source record: 167417

I know there is a optional AM filter and CW 500hz filter for the Yaesu FT-920. There is no narrow SSB filter available. My question to the Owners of the FT-920 is...Can you guys access the CW filter or AM filter in the SSB mode. I see a narrow button on the display.
The reason I ask is it would be great to install a narrow SSB filter say 2.1 KHZ from International Crystal. This way I could put the narrow SSB filter in line If needed but would still have the Wide SSB filter for General USE. Thanks in advance, Steve NS1R

Hi. I have a Pasokon SSTV board for sale. I'm the original owner.
The board is in perfect condition, and includes the software and manual,
and a copy of the original article in QST about the board. Asking $150.
I'll pay shipping and insurance (to the US). If interested, please email
to the address listed below, and we'll swap particulars.

Thanks very much,

Ken

Wrong. OSHA regulations only apply to employees of commercial firms.
That's the *Occupational* Safety and Health Administration.

>As far as that goes, do realize that a safety belt when improperly used
>will KILL you. If an individual was to fall with a 6' rope lanyard (one end

>The 2nd bounce 2800 lbs and the third is about 1800 lbs.

That's the same force he'd feel jumping off a 6 foot ladder
to the ground. It is quite a jar as I quite well know, having
been saved by a safety belt in such a fall. Ripstop devices
can soften that force, but I don't have a lot of confidence
in them.

>He will then only have 2 to 3 minutes to be rescued. This is as a result
>that circulation will be cut off to the lower body. The heart will then
>begin to pump harder to try and compensate. It will continue to do so until

>it literally blows up.

Total, complete, and absolute nonsense. You've obviously never dangled from a safety belt for any length of time. The biggest hazard with a safety belt is that you'll slip out of it head down. The next biggest hazard is that it will slide up on your body and constrict your breathing if you were wearing it too loose before the fall. The one thing it does *not* do is tighten up like a noose about your waist and cut off circulation to the lower body. And even if that were possible, the heart still wouldn't explode. How absurd.

The big advantage, actually the only real advantage, of a body harness is that you *can't* slip out of it when you fall. That can be a pretty significant advantage of course. :-) But if you are wearing the safety belt properly, there's not much of a chance of slipping out of it in a fall either.

>As another point, if one uses a harness they need to keep in mind that the
>anchorage point needs to be rated at 3600 lbs (engineered) or 5000 lbs
>(beyond reproach). If the anchorage point isn't it is possible that it will
>fail in a fall.

No joke. Always anchor to something solid.

4219. RE: GMRS Radios

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-23 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <970824151036183 91@atdbbs.com>
Source record: 167422

>> They are out of the GMRS radio business.

As far as I am concerned, they were never in the GMRS business. Nothing they ever sold was able to "hit" repeaters (CTCSS + frequency transmit offset), so there was no way anyone could recommend Radio Shack for any GMRS equipment.

>> It seems Maxon is the only game left in town and their's
>> is not a Cadillac...

Their Maxon 210+3 is the BEST GMRS radio out there - at the price - for serious GMRS work. And now that model is being phased out - for a model that LACKS front-panel programming of CTCSS. BUT the good news is that the 210+3 has been REDUCED FIFTY BUCKS - making it available for about $150.00...I can purchase 3 210+3s for the price of a single Icom U-16.

>> Mean while lets all send Radio Shack an E-mail or two.

What in the world for? If they sold GMRS equipment, it might possibly interfere with all their FRS customer's important communications. <g>

Not exactly an answer to your question, but.. be VERY careful with these x-CB amps. I've seen a few others that were converted to 10 meters, and found certain basic safety features to be missing. (for example.. the last one I worked on, the plates of the tubes still read over 100 volts DC -- and the amp hadn't been plugged in for over 2 weeks. There were no bleeder resistors!) Check all exposed metal for high voltage before getting near it.

After a voltage measurement, I'd also measure the resistance across the antenna output, and make sure it's low. (well under 1 ohm) If not, I'd connect a decent RF choke across the antenna jack. The purpose being, to blow the fuse (and shut down the high voltage) if the blocking capacitor shorts. 900 volts DC on your antenna (especially mobile!) is a very dangerous situation!

I think that a rig this small uses surface mount resistors- which
means basically burning it off with your soldering iron. all you have
to do is heat up the sides and then flik it off the board. Of course,
if you want to keep it, you may wish to use a pair of tweezers......

I want to second the above opinion. Although its been a few years now, I
sent my FT 757 in to Yaesu Factory service in Cerritos and received excellent
and timely service. I am a professional mobile radio technician of over 20
years experience and after initial investigation of my radio I decided to send
it to these experts on this unit. I have no regrets. They replaced multiple
parts in the receiver front end and did allignment checkout. For the $60.
they charged me I know I was treated fairly.

Ah....someone got my point. It is up to the individual to act responsibly and prevent the problem. The way each person does this is up to them. I encourage my fellow hams to carefully weigh the potential problems that the unfettered proliferation of modified radios will continue to cause to the relationship between amateurs and ems agencies. I also applaud the efforts of companies like Yeasu who restrict transmit mods to those with some demonstrable legitimate need like MARS/CAPS to help cut down on the problem. The bottom line is, however, it is up to the individual to do what is right. I don't want your radios, I don't want your guns, and I don't want your freedom, what I do want is for hams to stop and think if they really need to mod their radios for extended transmit onto non-amateur bands. That is all I was trying to say.

Sgt. Stephanie Steele

4235. kenwood ts570 DSP-Need Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-23 00:00:00 UTC
From: Ron <heger@erols.com>
Message-ID: <33FEFD10.61E3@erols.com>
Source record: 167496

The Kenwood TS-570 advertizing brochure has a section explaining the capabilities of the digital signal processor. One of the sentences in that section says "The super- narrow CW filter (50Hz) enables effective filtering even during crowded conditions." Does this mean that one can obtain a narrow CW bandwidth by use of the DSP without the need for a standard CW filter (typically 500 cycles) in the IF stage? If so, why does Kenwood offer optional CW filters for the IF? It seems logical to me that one is not needed if the bandwidth can be narrowed with the DSP.

Hi,

I have a Kenwood TS690s HF radio for sale which has 6m also.
This radio has had the optional Auto-A.T.U. fitted and also the
additional filters (3 no.)

I am throwing in a Manson 30A PSU and a 6m beam.

Immaculate condition (Still in original delivery packaging)

This radio is about 4-5 years old.

Buyer must collect (South Wales or Berkshire region)

contact me at adavies@mcmail.com
0958 380 501 (Mobile) please leave message.

73's DE GW0WXO, Anthony.

Kenwood HF-Transceiver TS-690S

The formidable TS-690S can star in virtually any role with its 100 W
transmission capabilities on the amateur HF bands -- in
SSB, CW, AM, FM and FSK modes. Compact, lightweight construction makes
this HF transceiver particularly suited for
DX-peditions. Rugged reliability is matched with leading-edge
electronics: optional automatic antenna tuner, AIP system for
improved dynamic range, Direct Digital Synthesizer for fine (1 Hz)
tuning, and the optional DSP-100 digital signal processor.

Features at a glance:

160 m ~ 10 m plus 6 m amateur band operation
500 kHz ~ 30 MHz plus 50 ~ 54 MHz general coverage receiver
DDS (Direct Digital Synthesizer) and digital PLL system
AIP system
IF shift function
AF notch filter

TS-690S: In Detail

AIP system for clearer reception

AIP (Advanced Intercept Point) is a Kenwood-exclusive circuit design
that improves the receiver's intermodulation dynamic
range to 108 dB. Two RF amplifiers -- one with large gain for enhanced
sensitivity, the other with small gain for better
intermodulation characteristics -- assure greatly reduced noise floor
level.

Ultra-fine tuning (SSB, CW and FSK modes)

Thanks to the Direct Digital Synthesizer (DDS), the operator can fine-tune in 1 Hz steps -- particularly useful for HF packet and AMTOR data communications.

User-friendly Primary function

Beginners and mobile operators will welcome the Primary function, which deactivates all but the most frequently used controls to prevent operational errors.

Heavy-duty cycle design

High-reliability components and a sophisticated cooling system assure circuit stability and make the TS-690S sufficiently rugged for heavy-duty cycle use.

Superior receiver performance and sensitivity

Triple conversion
Special circuit design, including triple conversion, enhances sensitivity above 24.5 MHz without affecting two-signal characteristics. This means better results when DXing and QSOing in the 24 to 50 MHz bands.
Selectable IF filter with memory
The operator can choose the ideal IF bandwidth depending on mode, band and QRM conditions. The setting can be stored in memory for later recall.

First-class interference reduction

IF shift function
This moves the IF passband away from interfering signals while maintaining focus on the target signal, thus maximizing gain and signal-to-noise ratio.
AF notch filter
A tunable AF notch filter with sharp cutoff characteristics minimizes undesired audio frequencies with surgical-strike precision.
Dual-mode noise blanker
NB-1 eliminates short duration pulse-type interference such as ignition noise, while NB-2 rejects longer duty cycle noise, such as "Russian woodpecker" interference.

High-caliber CW operations

Reverse mode
In reverse mode reception is moved away from an interfering signal, so the operator can tune in the target signal from above or below.
Pitch control
Dedicated CW operators will appreciate this feature which permits the CW pitch to be varied in 50 Hz steps, from 400 to 800 Hz.

Impressive split-frequency operations

TF-SET and "Delta" F keys
Split-frequency operations are greatly facilitated by the TF-SET (transmit frequency set) key, which can be programmed with the "Delta" F key so that the frequency difference is indicated on the numeric display.

100 memory channels with multi-scan functions

There are 100 memory channels -- all battery-backed and non-volatile -- for storing transmit and receive parameters such as frequency, mode, filter setting, AIP on/off. Of these, the upper 10 memory channels can also be used to hold both limits for the programmable band scan, programmable VFO and store mode, and related data.

Three different scan modes

The operator can scan any or all 100 memory channels, skipping selected channels with a lock-out feature. Group scan divides the 100 channels into 10 groups of 10 for separate scanning. And programmable band scan automatically covers from channel 90 through 99 within the predetermined band limits.

Simple data transfer between two transceivers

If two Kenwood transceivers are hooked up for dual-receive or master/slave operations, data can be transferred automatically via a special cable.

Optional automatic antenna tuner

An optional antenna tuner with microprocessor control automatically establishes the optimum antenna match between 20 and 150 ohms in the 80 through 10 meter bands. A warning beep sounds if a match cannot be found.

Optional digital signal processor (DSP-100)

The DSP-100 digitally processes both incoming and outgoing signals for maximum intelligibility with minimum bandwidth. In SSB operation, unwanted sidebands can be effectively suppressed, while in CW mode the rise and decay times of CW waveforms can be tailored for optimum clarity.

Other Features:

Digital bar meter and multi-function display
All-mode squelch circuit
All-mode RF output power control
Switchable AGC circuit (SLOW/FAST)
Direct frequency entry via numeric keypad

: Also new catalog "TECH America". Lots of parts, test equipment, scanners
: and Standard amateur gear. At Radio Shack, $2.95 but get $3 back on
: first order. If you call (800-877-0072) or use their web page
: (www.techam.com), it is free. Operators are very helpful.

I recently went to the first "Tech America" store which is located in Denver.
I was impressed, it has been a long time since I have seen a store stocked
with such an array of electronics parts and gadgets.

I was not asked for my phone number.

The sales staff was helpful and not pushy, most even seemed fairly
knowledgable about what they were selling.

The catalog is marvellous and I understand a new one is due out soon and is
three times bigger than the current one.

I don't live in Denver but I'll go back.

More Tech America stores are due in Atlanta and Dallas and other locations in
the future.

Very interesting. Just two days ago I talked to the Radio Shack media relations
guy about whether radio shack would be coming out with a TrunkTracker scanner. He said they might, eventually. Would appear he is in the same league as the sales people in not know the product line.

>
> Any resonse is appreciated.

I can't answer your question directly as we're not allowed that much
power here. We're allowed 400W at the antenna, and that allows me
over 500W at this end of a feed line with a measured 1dB loss. My
power meter goes up to 500W and I can get 500W out from 14mA grid
current with a single 3CX800A7 in a Commander VHF-1200 on 6m. So I'd
guess you should get 750W from each tube with 21mA or 42mA for the
two together. I doubt that the transient meter readings will mean
anything on SSB. And on AM, you'd better back off to no more than
375 watts unmodulated carrier output, both to keep things linear and
to keep your output PEP legal.

On CW, try backing off the drive a small amount and see of the plate
current does fall off. If it doesn't then you are overdriving the
tubes and causing both needless grid current and some distortion on
SSB. Keep reducing the drive until the plate current starts to fall
and then a bit more until the power out is about 90% of the power out
where it saturated. Hope that helps.

[
[Uh wrong 'em boy-o
[
[Of course OHSA isn't necessarily going to be looking for hams hanging from
[their personal towers, but the law applies to everyone, period.

Nope. The law only applies to those persons REQUIRED to wear fall-prevention equipment and only during the time that they are doing so as part of their employment.

Thus, even a guy who is required to use a harness on the job is welcome to do his George of the Jungle act on his 80' tower at home.

That said, I would point out that it is a standard practice to protect anything in relation to its value. If you don't protect yourself, you're worthless! ;)

What would you consider to be the best reasonably priced cw receiver in terms of selectivity, resistance to front overload for 80 -15 mtrs.

The rx can be part of a tx if that the best combination.

By reasonable I mean it cost up to a grand when new.

Hi Jeff

I have had the FT1000MP for almost 2 years now and for contestiong IMHO
it is superior to the kenwood and worth the extra cash.
It has two receviers which you may listen to simultaneously
one in each ear and tune for multipliers on one whilst working
stations on the other. The Kenwood again IMHO is not as good
at handling strong close in signals on 160/80/40. The Yaesu has
filters in the IF which allow much better strong signal performance
I have used the 870 in CQWW Contest on 40 CW and 20 SSB and the Yaesu
too. I muchg prefer the performance of the Yaesu, but I will concede
that I think the DSP of the Kenwood is better

5. ADI-PREMIER
6. REPEATERS
7. HAM-COMPUTERS
8. TVI-RFI-EMI
9. TEST-EQUIPMENT
10. YUPI
-----

MFJ-AMERITRON is a mailing list (reflector) devoted to the
discussion of radio equipment manufactured by MFJ Enterprises
of Starkville, Ms and affiliates (Ameritron, Mirage, etc).

* Amateur Radio Equipment
* Multimode, Packet Data Controllers
* HF and VHF Amplifiers
* Accessories
* QRP, VHF, Test Instruments
* Buy, Sell
* Anything MFJ Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe MFJ-AMERITRON

To be removed from the mailing list, send email as follows:

SUBJECT:
BODY: unsubscribe MFJ-AMERITRON

To post to the mailing list, send email as follows:
TO: MFJ-AMERITRON@qth.net

This reflector is provided by Al Waller K3TKJ at no
cost and I (K7ON) perform the routine administrivia.

Please contact me with any questions: k7on@qth.net

-----
```

GPS is a mailing list (reflector) devoted to the
discussion of the Global Positioning System and
uses relating to amateur radio, experimenting, or
other activities.

* Hand Held GPS Units
* Trackers
* Amateur Radio Applications
* Interfacing
* Buy, Sell
* Anything GPS Related

To join the mailing list, send email as follows:
TO: majordomo@qth.net
SUBJECT:
BODY: subscribe GPS

To be removed from the mailing list, send email as follows:

Problem solved. It was the Canned Diode (1N1239) inserted into the 5r4 octal socket. After trrouble shooting (dissconnect the caps, measure the resistance, measure the transformer winding resistances, etc, I looked at the socket that the diode can was plugged into. H.m.m.m still had the filament winding leads in place. So I replaced the diode with a tube from my handy dandy flea market stock and voila.... Now all I need is to uphgrade my license so I can work six and two meters. PS, when I powered it up I had an oil filled dummy load that my son helped me build one summer....

4253. VX-1 on 220 MHz

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-24 00:00:00 UTC
From: Andrew M Cohn <andy@vais.net>
Message-ID: <3400C727.2632@vais.net>
Source record: 167365

FYI... A modified Yaesu VX-1 will transceive on one and only one legal simplex frequency in the 220 MHz ham band: 222.000. The frequency can be programmed in on either the VHF-TV or the ACT 1 bands. Don't forget to check the receive mode to make sure it is receiving NFM.

I found nothing that precludes the legal use of this frequency for Novice and above, except that repeater operation on 222.000 is not permitted, and, if you are within 50 miles of a US Coast Guard AMTS station, you must provide advance notification of operation (the ARRL has information on this matter on their Web site, and maintains a non-Web database of AMTS locations.

Further, the ARRL band plan for 222.000 to 222.150 specifies this range for "Weak Signal Modes," which I suppose is just what you'll have with two VX-1's communicating with each other on that frequency!

So I guess what we have here is a kind of tri-bander with the VX-1, but it would have been really nice if it worked on the repeater freqencies, too.

> too.
Actually, it would be illegal to transmit on 222.000 because your
sidebands would go far outside the band. Remember a fully deviated
signal (at 5Khz) has a bandwidth of over 16 Khz.

You are pretty smart! I bought a cordless 900 MHZ phone from them and
it died after the 30 days. Walmart said to send it back to the
manufacturer. I simply purchased a brand New one and returned the broken
one for a refund. HA HA!

Can someone direct me to where I might buy a replacement ferrite rod which serves as the core of my AM antenna on my DX-370. Radio Shack doesn't supply this part any more. The broken rod is 120mm long and 7mm in diameter. Is there a parts house that has such things. I've looked many places here in Portland, Oregon and haven't had success.

Thanks,

Berk

I have a question regarding amps using 3cx800 tubes.

What is the grid current for 2 tubes when dead-keying 1500w CW or AM. Also what readings do you get on SSB.

The readings I am experiencing seem to be somewhat higher than quoted in the manual. Just curious as to others' experience.

Any resonse is appreciated.

It is easier to de-solder it because of its size and surface mounting. An attempt to use cutters would crush the component and possibly damage the board. If you could cut it, the result would be the same.

Source record: 167441

Herte it is! Icom has displayed a New HF Radio at the Japan Fair!
It is called the Icom 746. It has HF,6 mtrs,2 mtrs at 100 watts.
It looks like a shrunk down IC-756 and the list price is 198,000 Yen
which is the same as the Yaesu FT-920 so the USA street price should
be about $1700 after the radio has been on the Market for 6 months.
Also, Icom announces the T85 Handy which has 6 mtr,2mtrm70 cm list price
is 49,800 Yen. This info has been confirmed by two reliable sources.
As always NS1R Steve Hershman is the 1st to tell you guys about the NEW
Equipment.
I have been requested to ask you guys NOT to call the Radio Dealers
since they are the last to know about these and can't sell the radio
now anyway. They hate it when I SCOOP them and Alaways DENY the New
radio exists hoping to SUCKER you into buying an older model NOW.
73's NS1R Steven Hershman

Hi, I was looking for my copy of the original VX-1 mod post, someone in 4 land I beleive posted it. Anyway here is my version again:

Open rear of case by removing 3x screws

Be careful not to loose the hinge pin for the battery door...

If you have trouble opening the case, it's because it is held together along the left by a couple of plastic hooks. Reach inside the battery compartment and casrefully pry to first one or two loose.

With radio laying face down, look on the main PC board, in the upper left corner.

Beside the rotary switch notice two open jumpers JP0 and JP1

Using a VERY fine point soldering iron, and light gauge solder, CAREFULLY bridge accross each of these jumpers

Perform a CPU reset per the Owners Manual: While turning radio ON, press and hold the MV and AR buttons, then press FW

Radio will now have full VHF and UHF transmit, and will also receive accross the entire 800 MHz band(869.04 - 893.97 select 10 KHz steps)

Out of band receive performance is quite good up through 175 and even on UHF up through 500 MHz 800 Mhz sensitivity is not too good, only about 2uV, but that's better than speced in the manual atleast

An odd problem I have seen with mine, is that if I band select up to UHF and land on a 462 MHz freq, I have no problem TXing there. But if I step off of that memory to a regualr Ham freq CH, then go back to a non-Ham (UHF only) freq, and is stepup to decode CTCSS, I can not TX there until I cycle through all of the band selects, back to UHF again.

The good part that I theorize about all of the VX-1's programming quirks is that it could indicate a number of hidden "backdoors", although none have been noticed yet,,,, DE WA1YKL

Most places will only give you a cash refund on software if the package is
unopened but they will exchange it for a like item if it is damaged.
So take it back and exchange it for the like item, then take the unopened
like item back and get your cash. This is their rules not mine.

<Massive snippage>

Somehow my name ended up on the top of this and nothing below was
actually a quote from me. It DOES get confusing. (c:

I hate to tell you, t2s, but I am afraid it you that are wrong (assuming
in all these quotes and re quotes it is indeed t2s that said "Uh wrong
'em boy-o."

OSHA is strictly limited by congressional mandate to governing the
safety and health issues between employers and employees. This is not
even a commercial versus non-commercial distinction, as sole-proprieters
working for themselves do not come under OSHA regulation (unless they
have employees).

A few years ago I was working for a tower owner as a project manager
when I climber working for a tenant fell to his death. I got a very
intensive and quick education in OSHA regulations and fall protection
requirements over the following two or three months as the accident was
investigated. The law suits are still going on.

The only thing illegal (in OSHA regulated activities) about "safety
belts" after next January is using them as "safety belts". They make
fine "positioning belts" or "tool and material crrying belts".

As someone else pointed out, the main problem with using belts as part
of a fall protection system, is that top heavy people with no hips (me)
can easily slip out of them upside down, and skinny guys with no belly
will sometimes find the belt up around their armpits. One of the added
advantages to a harness is that the stop shock is distributed over more
of the body. Fall protection lanyards, rope grabs, retracting lines,
etc. should be attached to the D ring on the back of the harness as
opposed to a chest D ring. This allows the body to hang freely without
having the fall protection equipment slap the climber in the face when

it snaps taught.

Regardless of whether OSHA regulations apply or not, they are a good place to start in learning how to work at heights with safety.

Remember the non-linear tower heights axiom: Towers are always much taller from the top down than from the ground up.

Gray

>>play if you were to fall.
>>
>>
>>-- Rich K1CC

<<snippity snip>>

Why would anyone purchase a "safety" belt and a harness when a 3D harness
alone will function in fall protection and positioning (assuming lanyard
and tie off points are compliant)

Buyer beware (especially commercial ones)

OSHA 1926.502 (d)
Personal fall arrest systems.
Effective January 1, 1998, body belts are not acceptable as part of a
personal fall arrest system. The use of a body belt in a positioning device
system is regulated under paragraph (e) of this section.

OSHA 1926.502 (e)
Positioning device systems.
(1) Positioning device systems shall be rigged such that an individual
cannot fall free more than 2 feet
(2) Positioning devices shall be secured to an anchorage capable of
supporting at least twice the potential impact load of a fall or 3000 lbs,
whichever is greater.

Hi all,

Out of curiosity--anybody ever built the 20 meter CW/SSB transceiver from plans printed in the 1997 ARRL handbook??? I'm thinking about doing it, but haven't really looked into it too extensively. Is this a "intermediate" project, or a more advanced one? Worthwhile to build or no...?

Any opinions would be appreciated...

Thanks.

Tom

I found the picture at www.icom.co.ip/index.html. Some report 100 watts on
2 meters; However info indicates 50.
No dual passband tuning, no dual watch, no power on timer etc. etc. Along
with cheap price features are deleted. Appears to be smaller than the 756.

Guess they will intro at Dayton next year.

Hi Berk,
Several of the DX series were manufactured by Sangean.They have service
available,I think its in Ca.Try the 1-800-Operator.
They may sell you the correct part already wound,and they may know which
of their models is the same as the DX370.
If they don't know, check catalogs to find the model that looks like yours.
Good Luck

I had on along with many others.... The radio sucks.... I had my for several months and could not get any support worth having from Icom. The radio has so many problems that ther is a specia; users group on the internet.... AES Orlando finaly after a threat of littigation took the radio back.... I got a FT 1000 MP and think I am in heaven.... When I ask the same question you ask, some smart ass wrote back, Remember ICOM is a 4 letter word... you know he was right.

Don't buy a radio just because it looks good.... Check out the weight difference between it and the FT1000Mp... Something is not right here.

The 746 is smaller in size . It does not have the metered s meter, the
smeter
is built into the display, one feature i dont like. I like the meter on the
756 .
Love my 756 and would not sell it for the 746, Reasion being is, i like to
rec 2 meters wile on HF or 6 meters, with the 746 your not able to do this.

Other than that, the 746 is a nice looking rig.

www.icom.co.jp/news/ic-746/index.html

That where you'll find the picture.

AA lithiums put out 1.5V
else if people used them they would blow up their appliances!
They will work and give you a longer like than alkaline (at more expense)
The FT50 however, will still go ok at 15V on an external supply

Cheers
Sean
happy owner of several ft50's (best ht in the world)

If it doesn't work - I'm dead?! I'm curious, how do you "test" your
rope? I would assume form your sig that you know how to test things (or
at least you know how to break things). Do you wrap the rope around you
and jump from six feet to see if it stops you?

I trust my "ripstop" gear. It works or it doesn't - but either way I
don't fall. It is just a matter of how fast I stop.

I also trust my airbag to supplement my seat belt in the car - but I
guess thats why airbags have a big "SRS" stamped across the dash and
steering wheel - you know, "supplemental restraint system".

Regards

4323. Wanted: Solid State DC switching panel

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-25 00:00:00 UTC
From: adam.hardy@airservices.gov.au
Message-ID: <872559793.2566@dejanews.com>
Source record: 167401
Cross-posted to: aus.electronics,sci.electronics.design,rec.radio.amateur.equipment

Wanted: Solid State DC switching panel

Does anybody know of "commercial off-the-shelf", 19 inch rack mounting
soild state DC
switching units (remotely switched on/off by 50v, capable of switching a
28V 30A load, with alarm contact for 28V fail?)

The application would be for remotely powering on/off radio equipment.
Soild state relay is required in case radio equipment is accidentally
keyed up at "power-on" (conventional relays give a nice lightning show!).

Any advice would be appreciated.

From: dddavis@atl.mindspring.com
Message-ID: <5ttak7$lqr@camel12.mindspring.com>
Source record: 167309

The lithium AA's (if you are referring to the 1.5 volt version as sold by Eveready) offer the highest AH capacity and are light in weight. Unfortunately, I have found with some AA battery cases sold by Yaesu that the steel used for the contacts is surprisingly poor as a conductor. (It may be spring steel - I am not sure.) As a result, they work fine for receiving but when you try to transmit, you will see the voltage drop to near 4 - 4.5 volts. I thought for a while I had bad batteries until I tested them in a different holder loaded at 1 amp and found that they held up just fine. Bottom line is, you may not get anywhere full service from AA's (either alkaline or lithium) because of limitations in the holder. Maha and others sell a NiMH battery the same size as the FNB-40 which offers 7.2V output instead of 6. Not quite up to full power, but better than the FNB-40 in the same package.

In terms of energy density per unit weight, the batteries would rank as:

NiMH (a little better than NiCAD)
NiCAD
Alkaline
Lithium

I am not certain of the following data , but I believe it is in the ballpark. For AH ratings:

NiMH (Maha, etc.) .650 AH
NiCAD (stock) .600 AH
AA Alkaline 1.0 - 2.0 AH depending on load
AA Lithium up to 4 AH depending on load

It would not be possible to transmit at 1 amp for 4 hours using the AA lithiums. This number assumes a duty cycle with mostly receive (low current) use.

regards, Don (KE4KYO)

According to the new catalog, there is no HF transceivers planned for the coming year. However, when RS brought out the HTX-204, earlier this spring, nothing was mentioned in last years catalog, so that rumor could be true. Only time will tell. The HTX-404 HAS been discontinuted, so if you want to buy one, you'll have to hunt around. However, the price has dropped considerably since it has been discontinuted.

Icom IC-745 160-10 meter transceiver. Two VFO's, 16 memories, optional PS-30 internal AC power supply. Will run on 110VAC or 12VDC. Very hor receiver, plus onboard preamp. Has HM-12 up/down hand mic plus SM-6 deck mic and doc's. The top and bottom case has been refinished in gray (looks very nice) , front panel is like new. Overall condition is very good. USB, LSB, CW, RTTY, AM (no AM transmit) FM (with optional board). Covers all WARC bands and has general coverage receiver.

$550.00 shipped in the lower 48.

This radio is more of a CB than something designed for amateur or
professional use. Buy a Uniden HR-2510/2600 instead- the reciever in
this radio is much better, and the radio is actually cheaper, but it
is built much better than the 2950. The 2950 is an export CB chassis
with a computer latched onto it.

While I have been looking for satellite frequencies I noticed that some of the uplinks are below the 144-148 2 meter band, and some of the downlinks are also below the 2 meter and 440 band. While I can do the mars/cap modification to my radio to access those freqs, i have two questions... will the mars/cap mod void the warranty if I don't have a permit, and would I have to have a permit to transmit to the uplink of some of those satellites? I believe the frequencies are around 142 or 143 Mhz. By the way I have a Kenwood TH-79A.
Any help is greatly appreciated. Thank You.

Gary Coffman (ke4zv@bellsouth.net) wrote:

: >Your transmitter has a 50 ohm impedance and your antenna has an unknown
: >impedance on these other bands. All the tuner is doing is "fooling" your
: >transmitter into thinking it is a resonant antenna. What is actually
: >happening, is you are using your feedline as part of the antenna at that
: >point.
:
: No, you are not. The feedline is still a feedline, and the antenna is
: still the antenna. The feedline will not act as a radiator unless it
: carries *common mode currents*, and that's a function of the design of
: the feedline and antenna. The tuner has nothing to do with that.

Perhaps the first poster (the > lines above) meant that the feedline
length changes the impedance seen at the shack end of the feedline.
Normally the case since I don't think most antennas are going to
be 50+j0 ohms.

Anyway, I though about Gary's post, which was certainly informative,
and came up with the following tidbits, awaiting confirmation:

* A tuner at the shack end of the feedline cannot change the SWR
on the feedline. This SWR results from the mismatch of the
characteristic impedance of the feedline and the antenna impedance.
This SWR can cause increased power loss if you have a lossy line,
like some coax.

* A properly-tuned tuner at the shack end of the feedline causes the
antenna (load) to "see" a source (Thevenin or Norton equivalent,
for the EEs) with a source impedance equal to its conjugate impedance.
With a lumped model, this gives maximum power transfer from source
to load. Once again, this does not mean the line has 1:1 SWR. I
found this point to be enlightening for me.

* If you change feedline length, you'll have to change tuning.
Feedline length could help or hinder your ability to 'tune' the
system. Obviously, this is all frequency dependent.

* A 'high' SWR does not necessarily mean your antenna isn't
radiating max power. Maybe yes, maybe no. The type of
feedline can have a big effect here. I know the 'Reflections'
book makes this point, although I've only briefly glanced
through it.

One thing I've never really been sure of, does it make sense to say a
transmitter really has a 50+j0 source impedance? It seems to me I've
heardthat transmitters can drive 75 ohm coax with no problems, but I

have no real experience here. It seems like not a simple model...

Anyway, thanks Gary for a thought-provoking post.

4345. FT-747: Out-of-band Transmit ??

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-26 00:00:00 UTC
From: Jim Morgan <jvm@ats-forest.com>
Message-ID: <01bcb25e$953ffd40$bd485ac6@grayson1.inmind.com>
Source record: 167328

Does the Yaesu FT-747 transceiver have general-coverage receive ? Can it
be
modified for out-of-band transmit ?

Specifically, the desired frequencies are 4990 kHz and 7990 kHz (I
think...).

A friend in Haiti is looking for an HF rig which can transmit (& receive)
on
those specific frequencies, and which operates from 12VDC power.

Will the FT-747 fit this requirement ?
Are there other radios which will ? (Lower-priced used rigs preferred).

Thanks for the info !

73,

Jim Morgan WX4D

> You can get very good results using 1W-2W UHF handhelds;invest in a good

drop in charger or two,preferably a quick charger.You will definately
need a license,which is available from the FCC.New radios usually
include an application form. Check with a local two-way radio shop in
your area;they usually will have some used radios in stock,at appreciable
savings. Keep it simple--for your intended use,don't go overboard with
expensive radios offering bells and whistles which you probablly wouldn't
need in your work environment.I'd stick with handhelds.UHF works better
than VHF,for the most part,indoors.

Because you are putting the radio into a "limbo" mode. Most hams
should be able to remove a resistor and a solder blob. This is one of
the least complex hardware mods I've ever seen. Besides, some people
don't have the ADMS software.

In a word NO. There are no extended frequency mofd for the 202 short of strapping a scanner to it's back side with some duct tape. It was built that way on purpose.

4356. IC-746 MORE INFO!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-27 00:00:00 UTC
From: hershman <hershman@ix.netcom.com>
Message-ID: <3404D6AC.1FB8@ix.netcom.com>
Source record: 167260

I tried to forward the brochure to several Hams(one at a time) but I keep getting the 3Meg file refused. Is it to big?
No matter. I did talk to another Ham who attended the Japan Radio Fair last Saturday. He spoke to one of the Icom Reps there. He said:
the Ic-746 was made to fill a void in their product line. The radio is expected to be a Huge success like the IC-706. The Ic-746 is a fairly compact HF/6mtr/2 mtr at 100 watts all mode (no built in power supply). It has a autotuner and DSP built in.The DSP gets rid of heterodynes and white noise. It doesn't have slope tune feature. However, the radio is TRIPLE Conversion and has TWIN PASSBAND TUNING. (one passband knob for the 9 MHZ IF and another for the 455KHZ IF. I don't know about optional filters (narrow SSB or CW etc). I am speculating you can put at least one in each IF like the IC-756.(I'm guessing at that?)
I can't any info from Icom USA other than they agree the radio exists and that it will be FCC certified at some time in the near future.
I get the impression they can't talk about it since it is not FCC approved. My contacts say the radio should be available by Chritmas at the latest so put it on your Santa List! The price in Japan is 198,900 YEN. The Yaesu FT-920 Japanese price is 198,900 also and that costs about $1700 USA Dollars so I assume the IC-746 will cost the same.
I think it is fair. If you purchased a IC-706 MK II for $1300 plus the $500 autotuner plus a timewave $200 DSP you would spend $2000.Plus you wouldn't get $100 watts on 2 meters or triple conversion.
I will keep all informed of any new developements.

For Sale - Drake R-4C, Drake MS-4, McKay Dymek DA100 and Telex C-610 earphones

All are in MINT condition (appearance and function). I am the original owner and have never used this equipment much. The R-4C has all the crystals for general broadcast coverage, Drake model 4 noise blanker, original factory manuals, and I believe it has the Drake 6.0 KHz crystal filter. The McKay Dymek active antenna has oak wood sides. I don't know what this equipment is worth, and I will accept the best reasonable offer. I apologize in advance if I have posted this ad in the wrong place.

Source record: 167262

Using the included NC-66B/C/U AC Adapter that comes with the VX-1R the owners manual says to charge the battery for 2 hours.

What happens if you leave it on longer, say overnight?

Does the VX-1R have any sort of over-charge protection built in, or is the characteristics of the Lithium-Ion battery such that it can't get overcharged?

I know that if you put a NiCad battery on a 2 hour fast charger it had better have some sort of limiting protection if it is going to be left on for a long time or that battery will end up being toast!

Thanks for any info.

George

Well, they were selling a 50 watt 2m mobile for around $260 at Dayton,
the 2m and 70cm handhelds were in the $289 range when they first came
out. The 70cm rig is now $159 as a closeout. Doesn't seem to out of line
to me. Is someone selling a less expensive 2m mobile?

Actually, the tuner does not need to be mounted on the outside of the vehicle, but the output line from the tuner is actually part of the antenna, so the line from the tuner to the base of the antenna needs to be as short as possible. Trunk mounting is very possible ... just make sure that the output terminal of the tuner is near the rear corner of the trunk, drill a hole in the bottom of the trunk for the wire to exit via, and then directly to the base of the antenna ... in most vehicles, twelve inches or so from the tuner to the base of the antenna is very possible.
(What I am saying is that the tuner "tunes" everything from the output terminal -the big white insulator on the end of the tuner- on to the tip of the antenna - if that clarifies.)

That patch was a "custom" for Icom, built by the William F. Nye Company
(now in Priest River, Idaho - formerly in Bellevue WA).
Icom shipped an empty power supply housing over to Nye, who installed
one of their phone patches (046-006 was the number of the patch, if
memory serves me correctly), and shipped the unit back to Icom for sale.
Perhaps, if no one else can come up with your info, Nye might be able to
help you!

The SmartTuner does *NOT* have to be mounted on the outside of the vehicle. I know several people who have them on the inside. IF you mount it on the inside use a 1 inch diameter plexiglas rod with a hole drilled in the center for an isnulator going the the vehicl's skin.

Application you ask? You're an "RF Engineer" C'mon!!! It's for matching the impedance of the antenna to 50 ohms.

Tom

:I do not know if this is an attenuator or not, and the manual is not
:clear at all. It uses essentially the same words to describe the
:"normal" suqlch and the RF squelch. The only real differentiation is
:that the RF squelch is tied to the S meter reading. It doesn't say
:what the normal squelch is tied to. If anyone has further info on
:this, please post. I'd be interested, too.

Normal FM squelch is a noise squelch. When a signal is received the
squelch circuit detects the reduction in noise and turns on the audio.
Noise type squelch cannot distinguish between signals that are full
quieting and that is where the RF squelch comes in.

In addition to George Jefferson's comments, I'd try to find something with PL, CTCSS or "sub audible tone encoding". This will make using your radios easier in an office where there's a lot of hash and interference.

While this wont eliminate interference, it will make it easier on your personnel who don't have lots of radio experience. Most motorola radios can have this feature added but ask just to be sure.

Hello.

I am going to take a trip later this year by airplane and I want to hear from other amateurs about taking their HF rigs onto the plane as "carry on" baggage.

My plan is to pack a suitcase full of antenna wire and accessories and check it. I would like to put my 870 in it's original carton and carry it onto the airplane and put it in the overhead bin for travel.

Has anyone out there done this?

Will security give me the third degree when I take that radio through the X-ray machine? Will they even let me on the plane with the rig?

Can a radio the size of an 870 fit, with it's box in the overhead bin of say a 737?

Will a suitcase full of dipole antennas, coax and other wires/tools cause problems in the checked baggage department?

And for those of you who have succeeded with this type of trip, are there special contacts I should make at the airline to avoid trouble?

Thank you in advance for your experiences and assistance!

I've carried my handheld on the plane in a briefcase without any problems. You should see what it looks like on an X-Ray!! Looks just like a bomb. I can't believe they didn't even question me about it but, when I show up at the x-ray with my pager on, they want me to make it beep for them.
You may have to prove to them what exactly the radio is and that it actually works as a radio. That could be hard without a power supply. I'd suggest taking it all to the airport and talking directly to the security personnel to find out exactly what you need to do to make them happy. Getting there and saying "Well, so-and-so said I could do blah, blah, blah..." only tends to piss them off and make it that much harder.

Good Luck

A WORKING SB-101 with decent cosmetics, manual, and HP-23 power supply
is worth maybe $175 - $225.

4392. TechAmerica Store Info

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-28 00:00:00 UTC
From: ki0dz@juno.COM
Message-ID: <19970828.153445.15718.0.ki0dz@juno.com>
Source record: 167208

Hello again,
Since I asked for opinions on Alinco DJ-S11 I've received no information from folks who actually have purchased the rig. However, I've been deluged with information on the Denver store and whether there is mail order.
I must stress, I have absolutely no affiliation with TechAmerica or its parent company Tandy. (Read: This is NOT from any horse's mouth.)
TechAmerica is predominently a mail order operation (1-800-877-0072) but they very recently opened a store in Denver, Colorado (1-303-512-2060). Though they both have the same name, logo, owner, etc., their stocks do vary somewhat. The Denver store carries some items that are not available in the catalog, at least not yet. I just called the store and the gentleman there said that they would be available by mail order in the next catalog, but not at the sale price. The regular price is $119 (Alinco states it is $149).
I know that several Denver-area amateurs have purchased items from the store and have been very happy with them. I'm even thinking about getting one of their many kits. (Gosh, sure wish I had Tandy stock now!)

I, too am looking for a replacement antenna for my FT-50. My concern is a
little different (but a small antenna would be nice). I have done the
Mars.Cap mod and the freeband mod. I sometimes use my radio to test out
business band antennas for my customers. So I'm looking for an antenna
that's widebanded enough to handle the areas around 2 meters and 440. I
don't want to subject the radio to hi SWR. Any suggestions? Please email:

spoof@

Wrong... The ADMS software will not take 200-300 or cell freqs, but
you CAN store them using the keypad. Just enter in the frequency. The
coverage is 76-540 and 590-999. I have multiple UHF aircraft freqs in
mine. I program 100.0 in the frequency, but set up the name and tones
the way I want them. Then, store the freq using the keypad, and
re-enable the name using menu 3.

But then, on the other hand, you can put the receiver of the
transmitting side on a frequency known to be inactive ... it'll never
hear anything to transmit to/thru the other band, and the feat will be
accomplished.

I'm pretty sure all the Motorola radios use the same key, so you could
order it from Motorola or borrow one from a local commercial radio outfit
and have it copied. I did the latter and the locksmith said he could have
even copied his own key for me.

1. For those of you who cannot find the picture on the Japanese web page, the easiest way is to go to the icom (jp) home page, then click on JAIA 97, directly under the counter. Then click on ic-746.

2. According to my wife, who reads some Japanese, there are 4 symbols in the specs following the 144mhz power spec. It list the spec as 5 to 50 watts, and then has 100 watts in parentheses. The 4 symbols, which follow the 100 watts spec translate as "connection may be changed or modified" We'll just have to wait and see...

SNIP

I have the Comet SMA-3. I tested it before I bought it and on recieve
the FT50 was a little more sensative. I don't seem to notice a whole lot
of difference on transmit, its a little better. I don't think your going
to find a world of difference here, its still a rubber duck, just a bit
longer ....

take care, Bill

I will make a printout of the ICOM 746 Web PAge and bring it to the "BONZAI INSTITUTE" (a scool for Japanese people trying to learn English). It is near a service call I have to do later in the Week. I will give a gift Certificate (several $10) to the person who can translate the page). I hope they like McDonalds. I will in turn Post the English version for everyone on the Newsgroup. I asked Icom USA to do the Same but they admit the radio exists but that is all?
73's NS1R Steven Hershman
P.S. My Web brouser or Service would not allow me to send the 3 MEG file of the ICOM BROCHURE to several Hams. It just locks up? Eventually I have to reboot the computer!

>Will security give me the third degree when I take that radio through the
>X-ray machine? Will they even let me on the plane with the rig?

In most cases they will not even check it. The magic words are "it's been
used before". For all they know, it could be Hi-Fi, so just say "it's a
radio" or "it's a tuner" and say that it's used (i.e. you didn't
buy it two hours ago).

As for it being a radio, well on two occasions not only have I carried a
scanner on board but I even asked the captain if I could listen to his
conversation during the flight, to which neither had a problem.

One wanted to make sure it's only a receiver and the other wanted to
make sure it will cause no interference. I got a kick out of it when
the hostesses were asking everyone to switch off their personal stereos
and what-have-you during landing. As soon as they saw me they said
"you have permission from the captain, haven't you? It's ok then" :-)
After the hostess left, the person sitting next to me said "if we crash
it's going to be your fault" :-)))))

4420. WANT INFO - KENWOOD UHF/VHF PROBLEM

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-28 00:00:00 UTC
From: swoodwar@fix.net
Message-ID: <5u3u4t$p8c$1@zinger.callamer.com>
Source record: 167287

Has anyone experienced a problem with the TM-732 Kenwood as far as the
UHF receiver. Seems when I transmit it takes out the two RF Amp
FET's. Had it fixed, put back in service, first time transmitted,
wiped out the FET's again. Bad switching diodes?

I like the idea of a diary. Maybe other amateurs can learn from your
activities. More hams should do this.

>Also, straight from the horses mouth: I have confirmation from Yaesu that
>the MARS mods can only be done at the factory with a firmware load.

Not true. My Dad purchased a 920 and it was modified at the dealer.
I took a look under the cover and could clearly see where the dealer
removed some etching from a circuit board.

In case you were wondering, I checked out the rig on a dummy load and
it will transmit across the entire HF spectrum.

Do you think that they [Yaesu] might have changed the design spec for
the 920? I think that it is just Yaesu trying to get a handle on
freeband operators. Actually, this is a great idea. I can't stand
those clowns poking around on 10 meters.

4427. Opinions Solicited on the Alinco DJ-S11

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-28 00:00:00 UTC
From: ki0dz@juno.COM
Message-ID: <19970828.112910.15854.0.ki0dz@juno.com>
Source record: 167294

Howdy from the Centennial State,
As readers may or may not know TechAmerica recently opened a store in the Denver area. Today's "Rocky Mountain News" carries an ad for the Alinco DJ-S11 and DJ-S41. For the next four days the price at the store is only $88. Does anyone have any experience with this rig? If so, what do you think of it? Pros? Cons? I'm trying to get into cycling (just for fun, not racing or anything serious) and I thought it might be nice to stuff one of these rigs in my tiny saddle bag. With repeaters at 8, 11, and 14 thousand feet altitude I would expect I could use it to get help for either myself or someone else on the trails.
Thanks for any info you can provide!

You'll notice that in the manual that it states this is
normal. I suspenct it has more to do with some kind of processor pin
multiplexing (multiple use of a single port pin) than anything. To
bad Yaesu doesn't have Icom's equivalent of Gary Fiber on the net. If
it was an Icom product, he'd tell us why...

I've interviewed a number of "grads" from our local pay-your-bucks,
get-a-diploma school (DeVRY). I was always amazed that every transcript
I saw had nothing but A's and an occasional B. I NEVER saw a C or a D
on any transcript. We hired a few based solely on attitude, but had to
train'em when they came on board. We were lucky if they knew what a
soldering iron was for!

Egghead closed its doors in Kansas City and slipped away. I work just a block away from one when they were open. One day they were there, next day empty! Musta brought in a truck in the middle of the night an hauled everything away. Just left an empty store.

Anyone who has the mods for a Yaesu FT-416 for transmit, please E-Mail me at Cawley@epix.net. Thanks.

4438. IC-746 more info.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-29 00:00:00 UTC
From: hershman <hershman@ix.netcom.com>
Message-ID: <34075A8C.6E0F@ix.netcom.com>
Source record: 167156

The people at Icom USA are not advertising the radio on their Web page
because they say the radio "may or may not be offered in the USA".
They say they are not sure if the Ic-746 is just for the Japan market
only.
Please put me on the record:" If this radio is not released by the
Spring 1998 (latest)..I will stop posting all messages to the Ham radio
newsgroups! That alone may convince Icom USA to not sell the radio(Just
kidding Ha ha).
I have received many Emails from Ham Radio Salespeople asking me not
to post this stuff since they get calls on their toll free phone #
and it is a waste of their time. This is a "EQUIPMENT NEWSGROUP"!
Once it is in the catalog it isn't news anymore. You wouldn't buy last
weeks newspaper would you. Also, When Icom has pictures of the ICom 746
and the NEw T8ss 2mtr/6 mtr/70 cm handheld on their Japanese Website
plus didplay it at the Japan Radio Fair it is now Publick Knowledge!
I will continue my postings.

My guess is it will be the same as the IC-756 and IC-706 MK II.
Some day they will get it right. It seems every review of a Icom HF
Transceiver gets bad grades in this dept. Will they ever learn?

Paul,

I think you are confusing an IC-02AT with an IC-2AT.
An 02AT has keypad entry. Dale's instructions only work on an 02AT and
then only after internal modifications to the diode matrix.

>technology.

I suppose your are implying there is some connection there. Like the part of my .sig that you did snip says, I don't speak for my employer. But since you brought it up, if you check out the Qualcomm homepage more closely, you will see that the technology Qualcomm is pushing is CDMA for Cellular and PCS. CDMA is a 1.25MHz wide spread spectrum digital signal that is also encrypted. There is no scanner in the world (besides buying a Basestation Transciever System and a Base Station Controller ;)) that will let you listen in on a phone call, so you might conclude that Qualcomm doesn't give a dam about scanners. I don't know, I never asked them. If anything, you would think that having scanners available that can monitor cell phone calls would help Qualcomm sell the idea of digital encrypted phones even more so.

Anyway, enough of the defensive stuff; I've continued reading the laws and proposed bills in question and have found some questionable things in it. I would have to now say that this is not a good bill.

4455. WB6YSL review of the VX-1R

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-29 00:00:00 UTC
From: norman_noble@pcworld.com
Message-ID: <872749669.32549@dejanews.com>
Source record: 167227

Hello,

I recently bought a new VX-1R (August 7, 1997). I have been a HAM
for 20 years and do more monitoring than transmitting.

EXECUTIVE SUMMARY:
Following are my impressions after three weeks of use. I hope that
my comments will be useful if you are planing to purchase one of
these. To summarize, I believe that the VX-1R is an amazing
technological accomplishment. It is a feature packed programmable
receiver but is no substitute for a scanner. The transmitter is
very low powered (500 mW) and is rarely practical. Even at 500 mW,
transmitting rapidly drains the battery.

With its wide-band capability able to run off a single AA battery,
it's in a class of its own. It's more of a toy for the amateur who
already has a higher powered transciever. It's very cute, and will
impress your HAM friends and is guaranteed to be a conversation
piece.

PROS:
1. I am amazed with the small size (about 4"x2"x1").
2. Relatively simple to program and navigate. Most functions use
five of the seven buttons.
3. PL and DPL encode and decode is built-in.
4. Very customizable with many battery conservation options.
5. The lithium ion battery (supplied) charges in about two hours.
6. Audio is quite clear considering the size of the HT.
7. Wide-band FM is available.
8. Two selectable CPU clock frequencies to deal with "birdies".
9. Ability to use a single AA alkaline battery with optional FBA-20
battery holder. (Battery life is reduced to about 33% and transmitter
power is reduced to 100 mW).

CONS:
1. The VX-1R only has 52 memories that will hold PL settings. The
remaining channels can not store PL. Yaesu did not mention this and
advertised the radio as having "291 memories" and "PL/DPL". As far
as I'm concerned, Yaesu lied to its customers.
2. It's not possible to recharge the battery while using the HT.
3. The supplied antenna is pretty bad. If you buy this radio, be sure
to set aside cash for an aftermarket antenna such as the Diamond
"SRH519" (about $35).
4. No PL or battery saver (sleep) mode functionality in VHF-TV
(170-222 MHz) and UHF "T" band (470-799 MHz).
5. AM broadcast band reception works, but no frequency display is

provided and must be adjusted by ear. Also, reception on this
band is limited to only strong signals.
6. Spectrum is divided into nine bands. Yaesu chose some ackward
names which takes a little getting used to. For example to listen
to 223.500 MHz, you must first select the "ACT 1" band.
For 488.0000 MHz, you must first select the "UHF-TV" band.
For 901.000 MHz, you must first select the "ACT 2" band.
7. The "emergency" button (used for "distress" situations) is pretty
useless. All it does is make a beeping sound. It would have been
nice to make this a user programmable button instead.
8. The user manual is unclear with regard to erasing stored memories.
(Yaesu calls this "masking memories").
9. Priority channel can not be set for frequencies on the UHF "T"
or 800 MHz bands.

73,
Norman Noble

I HAVE THE IC-746 Japanese Brochure! I have sent it to a
Japanese/American Ham who says he will tranlate it and post to the
NewsGroup a summary of its contents. The file is 3 Megs so it takes
about 15 -20 Minutes to download. If this Guy "Peter" can't do it I
will send the Brochure to 10 other Hams who offered to translate it
by Sunday. I won't post it to the Newsgroup since it is so Big in Size.
This is the Brochure that was given out at the at the Japan Radio Fair
last Saturday. Icom USA refuses to post the English version of this
Brochure on their Web Page.

Hi,
Does anyone know what the CCS or ICS rating for the plate transformer used in the old Motorola Micor racks were? The rf deck used 2 8560as conduction cooled tubes, so it had to be atleast 500ma. I want to use it for a supply to deliver 800 to 1000ma. Please e-mail your response direct to
kb8jvh@nextek.net
Tnx

I figured out how to send the 3 Meg file of the Icom IC-746 Brochure.
I sent it this morning to a Japanese/American Ham who will translate
it and post the summary to the group. If he for some reason can't I will
send out the Brochure to 10 other Hams who requested it. It is 3 Megs
big and takes a bit to download. I hope "Peter" gets the info to us
soon.

If I don't hear a reply to my IC-746 brochure I will post to Geoff Brown
if he wants it.

4464. Re: Dumbing down of Ham Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-29 00:00:00 UTC
From: bumologist@pipeline.com
Message-ID: <MPG.e70a324cacd7dca98969e@news.pipeline.com>
Source record: 167236

Ever notice that almost everyone who advocates a no code license are
those without a higher class license or has no license at all?.
>>I had a Novice license when I was in high school,and back then,I had to
learn the code.I didn't like it then,and don't like it now.....
Learning the code is not that hard if one is willing to spend the "time"
it takes to learn.
>>I don't want to learn it again!I WILL never use it.I still remember
most of the letters and num.from my last attempt at getting better than
6-8 WPM.I tried quite a while,then said to hell with it,it was making me
nuts!
I was so nervous on my first QSO that I lost contact with the other
station.
>>I got ditched on my first two QSO's.That was enough for me,I threw the
license in the drawer,gave the rig back,and went back to CB.I was totally
disgusted with CW.
>>Its funny how my attitude changed once the hard work was over. So come
on you no code guys, give it an honest effort and put in the time it
takes to learn.
Jim, WK1V
Well,how about you having to learn BASIC before you use your new
computer??Hardly anyone uses it anymore,but you should have to learn it
because....I had to learn it 15 years ago?That's insane!!!!But that is a
CW "fanatics"logic!I'm into rtty and sitor,but I don't think it should be
a req to know a lot about these modes for a license.I resent the CW
req.and won't even attempt to mess with it again.I'm a ARRL member,and I
feel they have done more to HURT ham radio the last 30 years than they
have helped by far.Well,I'm done ranting...........

Message-ID: <19970829175801.NAA08249@ladder01.news.aol.com>
Source record: 167241

Bob, all the transistors you listed are still available through Motorola's
American Parts Division (http://www.mot.com/accesspoint/) The part numbers
have been updated as follows:

M9622 is now 4800869622 and lists for $26.00
M9623 is now 4800869623 and lists for $31.00
M9624 is now 4800869624 and lists for $35.00
M9625 is now 4884411L34 and lists for $46.50

If you are looking for an alternate source, check Phillips/ECG parts.
They are as follows:

M9622 = ECG353
M9623 = ECG354
M9624 = ECG355
M9625 = ECG356 (discontinued)

Hope this helps.

73, Robin Deputy KE9SQ
Technician, Wear Radio Service

> Does anyone out there know what a "Sideswipper" key is for cw?

Keys that make/break contacts sideways rather than up/down. Modern dual-paddle paddle-keys for Iambic keyers are a derivative of sideswippers with separate circuits with separate circuits on each contact. Paddles for non-iambic keyers have one paddle, two circuits (one for dit and one for dah, just like a Bug). Old original sideswipers had one circuit for both contacts, you could make dits or dahs on which ever side was handy.

> were also called "cootie keys" in the old days.

Bugs were sideswipers with a mechanical linkage doing the function of a solidstate keyer. But with a couple of screws, a couple of old coat buttons and a busted hacksaw blade you can build a sideswiper straight key.

> with same do you know if a commercial version was ever sold anywhere?

White Rook has side-swipers with or without keyers, one or two paddles; put in a jumper or a stereo-to-mono plug adapter to make it a single circuit key.
http://www.west.net/~wpc/home.html

I need to try one of these, since they say you should develope a fist before trying IAMBIC, but I know the classic "straight key" action would be bad for my wrists (which I'm babying with trackballs and lumpy keyboards to protect the miles left on it).

That is COMPLETELY false ... while I, personally, "only" have a tech+
(actually an "old tech who took the full general test of the 1970s at the
FCC office), MANY of the proponents of dropping the code test have
higher class licenses ... many of them are even CW enthusiasts who
are smart enough to realize that "you catch more files with honey than
with vinegar" and that forcing the code down everyone's throats is both
unjustifiable and counter-productive in many ways.

Gee Vart, I guess you think it's great sport to play electronic
roulette. I suppose you know the frequency and effective radiated power
of every fundamental, harmonic and spurious emission of your equipment.
And then you know the exact immunity profile of every navigational aid
and aircraft control system. Hey, Vart says it's safe!

Oh, right, Vart shuffled this decision off onto the pilot in charge.
Right, like he's competent to judge that. But at least he had the sense
to ask the right question.

So tell us, smartass, how did you convince him it wouldn't cause any
interference?

4485. Yaesu FT-5100

A typo in the message, but correct in the signature.

The (very informative) site is at http://www.wm7d.net

If I decide to take advantage of the current $100 coupon on the 920
(and the 10% rebate on my MBNA Amateur Radio MasterCard [I've been
channelling purchases through it for a few years for this]), then
I'll probably contribute my experiences to Mark's page.

>Wrong... The ADMS software will not take 200-300 or cell freqs, but
you CAN store them using the keypad. Just enter in the frequency. The
coverage is 76-540 and 590-999. I have multiple UHF aircraft freqs in
mine. I program 100.0 in the frequency, but set up the name and tones
the way I want them. Then, store the freq using the keypad, and
re-enable the name using menu 3.

Hmmmmm......seems you all need version 1.4 of the ADMS software to program
all those nasty little off limite frequencies.....I have both.......1.7 and
1.4. not the best software in the world and kind of clunky, but easier
that hand programming each one......as and ye shall receive.

I have about 1000 "The Clip" universal belt clips.
This belt clip is great on anything up to (believe it or not) 15 pounds!
It attaches to your device by a super strong curing epoxy double sided tape (included). It is virtually indestructable (I'm sure somebody can prove me wrong!).

I have used them on cordless phones, cellular phones, ham or commercial radios, pagers, virtually ANYTHING you want to put on your belt. Beveled edge slides on your belt easily.
I have seen people use the clip on other than a belt, such as part of the car.

Radio Shack has the EXACT SAME CLIP in the catalog (43-168) and on the shelves for $4.99ea.
Your price is $2.50ea + $1.00 shipping.
Or 5 for $10 + $1.75 shipping
Orders shipped as soon as payment received (don't worry, I won't run out!)

Send check or MO today to:
Dan Magro W7RF, 2668 Butler Ave. Los Angeles, Ca. 90064, (310) 821-5244 days
Address verifiable in the callbook

Hello, John.

There are six classes of amateur license in the US. Most people start out with the Technician license. This is a simple written exam on rules, regulations, and a small amount of radio theory. It allows you to operate on all amateur frequencies above 30 MHz. About 43% of current amateurs hold the Tech license. Radio Shack sells a book titled "Now You're Talking" which will aid you in passing the exam.

Exams are given by volunteer examiners. These exam sessions are usually sponsored by local radio clubs. If you go to www.arrl.org, you'll find listings of exam opportunities local to your area. You can also check with local radio clubs.

To acquire a license permitting you to operate below 30 MHz, you need to pass a Morse Code exam as well as a regulations and theory exam. There are 5 classes of amateur license which fall in this area. They have progressively faster Morse exams and greater regulation and theory exams with correspondingly greater privileges on the HF bands.

Note that the privileges gained don't correspond well with the material tested (particularly the Morse speed tests), but that's the way it is (for now, there is a movement toward licensing reform). Anyway, if you want HF phone, image, and digital privileges, you take a Morse test. And the faster the Morse test you pass, the more phone, image, and digital privileges you get. (Makes no sense? You bet. But that's the way it is.)

Equipment for either VHF+, or for HF, ranges widely in price. You can get started for as little as $50 with some careful shopping of the used equipment market, or you can spend upwards of $3,000 for a fully equipped HF station. Typically, new amateurs spend about $500 to equip themselves to operate (radios, power supplies, antennas, etc). You can do better than that, but you have to know a bit more to make a wise purchase.

Most new Techs immediately buy a handheld transceiver (called a HT). This may not be the best choice. While a HT is very portable, its performance leaves a lot to be desired. If you have a car, a moble rig is probably the better choice (and you can use it in the house with a 12 volt power supply too). These have much better receivers and much more powerful transmitters. But if you're on foot a lot, the HT may meet your needs.

I could go on for pages about which radio to buy. There are lots of good ones out there, and a few clunkers. Part of the choice will depend on what you want to do with the radio, part will depend on where you want to operate, etc.

Much of VHF/UHF operation revolves around local *repeaters* run by local clubs (a repeater is a radio system mounted at a favorable location which listens for signals on one frequency and retransmits them with high power on another frequency). They are used as range extenders and as gathering places for groups of local amateurs. Each repeater develops a "personality" of its own depending on the group using it. It will pay you to explore these different groups and determine which one fits with your operating style, interests, and personality. That will determine in large part the sort of radio you'll want to buy, IE whether VHF or UHF or both. In many areas, it pays to get a radio which will do both, but in some areas, only one of the bands will be of interest to you.

Another area of VHF/UHF interest is operating amateur satellites or doing other "weak signal" work. This requires a different sort of radio, called a multimode transceiver. All of these are desktop units. They cost a bit more, but do lots more than the FM-only rigs. While you are limited to only a few miles range in most cases with FM operation (though repeaters can extend that), with the multimode radio you can *directly* work amateurs hundreds of miles away, or by satellite much further than that. This is exciting to some amateurs, others could care less.

There is also *digital* operating. On VHF/UHF this is mostly *packet radio*. For the lowest levels of this activity, almost any FM radio will do. For more advanced use, you'll need a specialized radio designed for digital operation (called an RF modem). Packet is a bit like the internet in style and content. There are BBS stations, mail forwarding, etc. Performance is generally much lower than you experience on the internet, however, unless you have a local group doing advanced packet. Some of the advanced systems are quite a bit better than the internet itself for the local loop, but this is a matter of local usage, IE it does you no good to obtain advanced equipment if no one else in the area is using it too. Digital operation is very much a *cooperative* activity, unlike most other amateur activities, so you need to get with a group to participate.

HF is another world. While you *can* use it in ways similar to VHF/UHF (but on a larger geographic scale), most amateurs operating HF play games called Dxing or contesting in which they try to contact stations in exotic locations (often some God

forsaken rock where other amateurs have temporarily setup a station), or try to contact as many stations as possible in a limited time. This can be fun if you are into competitive gaming.

This activity can be very cutthroat, and you may find yourself buying elaborate and expensive equipment to be competitive. It doesn't have to be that way. You can have quite a bit of fun with very simple equipment. And you can chat with people in many locations. If you like meeting and talking with new people, HF may be for you. There is also quite a bit of educational value in exploring propagation on HF. It is very different from the (mostly) consistent and predictable behavior of VHF+.

Now I've talked mainly about operating so far. That is a major reason to be a radio amateur, of course. But there is another major reason, and that is technical exploration and learning. Only radio amateurs are permitted to *build* radio transmitting equipment and experiment with different modulations and encodings. There is much to be learned by doing this, and much fun too.

I don't recomend that you start out building your first station. You *can* do that, but one of the very best pieces of test equipment an amateur builder can have is a working commercial transceiver. So you should probably buy your first radio and use that as an aid to building other radios.

You may not want to build entire radios, you may prefer to *modify* existing radios. That's a very valid and useful way to proceed as well. You'll find that you can almost always *improve* any commercial design with well thought out modifications. (I'm not talking about out of band "mods" here.) In fact, a very inexpensive way to get a good amateur radio is to modify a surplus commercial radio. Many VHF/UHF operators use modified commercial two-way radios. They are generally of very high quality, and can offer you a very inexpensive way to obtain a high performance station.

Then there is building on a higher level of abstraction. We might call this system engineering. It has become an important part of amateur radio. Rather than working at the individual circuit level, many amateurs have chosen to work at a higher level, combining system modules to produce a high performance integrated communications system.

This can be a fascinating and challenging activity, particularly if you are interested in more modern communications methods. Much of this is software driven. Using DSP evaluation modules, or computer sound cards, along with convienently available RF subsystems, you can produce new and novel architectures featuring advanced modulation methods. I find this area particularly exciting, and a way that amateurs can contribute to the communications state of the art. All communications is moving in the direction of digital and software driven architectures. This is *the* hot area for amateurs interested in working on the cutting edge. And it can be remarkably cheap to participate. This is one area where the

amateur working on the tabletop is at no significant disadvantage to the professional working for a huge conglomerate.

Does anyone use the detachable front panel capabilities of many
mobile radios for security purposes (Similar to detachable face car
stereos). I know that the main reason is for more options when mounting
the radio but it seems that security would also be nice. If the
manufacturers do have this in mind and many people do use it for this
purpose than do these radios have cases for the face? Possibly a stupid
question but I can not find any info on this.
Thanks

Try rec.radio.amateur.policy or rec.radio.amateur.misc . You'll find
lots of beep-happy code nuts there. Look for a guy named Larry Roll.
He's the nuttiest of the code nuts. I'm sure he'll be happy to hear
from one more.

Decent little radio, There are some good mods around on it to make it even
better. sept '89 73 mag has a 100 watt mod for it. I put the frequency
expansion mod in mine, worked great. Trying to figure out how to disable
the BFO for AM reception of 11m. Not many hams out there giving road
condition reports.

Source record: 167197

Hi,

I have lived in many apartments throughout my ham career of 25 years. I am now 40 years old and live in a house. I have used 2 different HF rigs in the conditions you descibe. One was a Heathkit HW 101 and the other was a Kenwood TS530S. I still have the TS530S which is a 100 watt digital frequency read out transceiver that still works great. I would be willing to sell it for about $500.00. It also covers the 30, 17, and 12 meter bands and works great. As for an antenna as the other message stated a dipole or a long wire works great. All you need for a random length of wire to work as an antenna is an antenna tuner and those can be found quite cheaply.

I was able to work all states and over 100 countries with the TS 530 S and an indoor dipole antenna that I had in my attic.

Good luck and good DX

Yes, I have seen people remove them for security. I have done
it myself once or twice. It is usually easy to do, especially
if the mike plugs into the radio rather than the faceplate.

Hi, I leave my VX-1 on charge overnight all the time, no problem. The 2 hours stated in the manual is the MINIMUM time needed to charge the battery. I actually think that 2.5 hours is a bit more accurate. 73 DE WA1YKL

Jim;

I found a small slip of paper in the box, someplace. (Maybe with
the warranty information?) At any rate, this was where I read the
"ignore the clicking" information

I noticed that this same clicking noise is heard whan the DC (cigar
lighter) adapter is employed. I watched the current draw when the DC
adapter is used, and the CLICKS are in sync with the "major current
pulses" seen in the 12 volt DC feed line.

I have heard from two hams that don't know eachother that the mod
involves cutting a copper trace on a PCB in the radio and is simple.
The story about sending the radio back to Yaesu to get moded is a bunch
of lies.

I am considering getting the ADMS software and cable. What I'm wondering is if there are any other software packages designed for the interface cable. It seems that ADMS is mainly a frequency management program... is there anything that can control the radio actively, during scan/search, like some of the scanner control software that's out there now, or is this an impossibility for the ft50? Please let meknow if you have any info.

In the new Radio Shack catalog on page 41, the belt clip is advertised
at a reduced price of $3.49. You are asking $2.50 + $1.00 = $3.50!
Doesn't sound like a deal to me.

Scott,

I'll try and attach a .GIF to the end of this message. If I'm not
successful, or if you have other applications, take a look at:

http://www.sedan.org/allalnco.gif

for the Alinco info. The Sedan pages have many, many good drawings on
how to interface radios to tnc's. Those pages start at:

http://www.sedan.org/wiring.htm

Their main homepage is of course: http://www.sedan.org

Lots of good packet info there; well worth poking around.

Hope this helps you out.

Hello!

I'm looking for information about how to connect a FT-780R (or a FT-480R) to a PC in order to do automatic doppler correction for satellite use. I would like to know if there is any way to digitally change the frequency (something similar to CAT system). The UP/DOWN system would work if I can send to the transceiver the correct starting frequency.

Thanks and best regards.

I have an excellent condition Yaesu FT2400H 2 meter radio for sale. This is in the original box, packing and instructions. It is a great mobile or packet radio. I will sell for $200 plus S&H. Please email me. Thanks. HT KF4SXT

4536. VX-1 ADMS Software

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-31 00:00:00 UTC
From: Andrew M Cohn <andy@vais.net>
Message-ID: <34096148.D6B@vais.net>
Source record: 167119

Rumor has it that when the VX-1 AMDS software/cable is released by Yaesu in October, it will be possible to overcome the limitation of having to access individual bands to scan the frequencies programmed into that band. If this is true, it will overcome one of the primary disadvantages of this unit, making it possible to continuously scan a variety of frequencies in basically one "bank", i.e., without the need to switch to UHF-HAM to receive a 440 frequency, and then to VHF-HAM for a 2-meter frequency, etc., etc.

I'd like to believe this will be the case, but I have my doubts. I wonder if such a feature is even technologically possible on the VX-1? If it is possible, why hasn't Yaesu promoted this feature in the section of their Web site that announces the upcoming release of the software?

Is there any historical evidence that ADMS software can overcome keyboard limitations in such a fashion? Is anyone familiar with this concept enough to comment on the possibility of mixed-band frequency storage into a single "bank", based on other Yaesu units and their respective ADMS software programs? If so, I'm sure a bunch of us VX-1 owners would be happy to hear your thoughts.

4539. IC-2A forsale, as is.

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-31 00:00:00 UTC
From: w1_k_sorter@qsl.net
Message-ID: <5uc1fm$f09@news2.tds.net>
Source record: 167122

Hi Everyone,

My neighbor brought over his ICOM IC-2A (no touchtones or subaudible tone capability, no belt clip, carrying case or hand strap-it is average cosmetically and both halves of the case are cracked on the right side) for me to repair. It has a normal sounding receiver (audio and squech work), but receive sensitivity is way down (a local repeater that is normally DFQ on a rubber duck is barely audible and very noisey even when an outdoor ant is used).

Further, the tx power is low-it barely moves my power meter, well under 1 watt-in the low power position, the output is ZERO-doesn't even make the meter flicker.

I learned that the failure happened after he operated the unit on an improper voltage battery pack that wasn't made for the radio-so, it has been exposed to an over-voltage condition.

I advised my neighbor to write off the radio-radios that have had reversed or over voltage applied are sometimes a constant string of component failures as the junctions of the semiconductors break down one at a time over a period of months/years (similar to lightening struck radios).

He suggested that it should have some re-sale value, he paid good money for it.

So, it's forsale. AS IS.

Have 2 battery packs, believed to be good, and the stock wall charger.

Might sell batteries separately.

Make offer or comment.

GL de K.

James Adrian van Wyk (jimvanwyk@worldnet.att.net) wrote:
<snip>

: I'm an engineer (BS, MS, PE), with 40 yrs., in the profession. True the
: schools are removed, from reality, but industry is even further removed,
: from reality. Much, of the problem, with engineering education, is that
: it caters too much, to industry, and also, to today's culture. The
: distortion, of engineering education started, after sputnick, when it
: was distorted, to produce "cubicle prisoners", for the aerospace and
: defense industries. Later engineering education was periodically
: remade, to produce the latest kind, of "cubicle prisoners", that
: industry thinks it wants. I'm glad I'm old enough, to have gotten my
: BS, back, in 1957, before government and industry got, to control the
: schools, to meet their (very) short term wants (wants, not real needs).

A good commentary.

I must agree with you on industry being out of touch and concentrating too
much on the short term. I'm finding that the "alliance" between schools
and industry may not necessarily be a good thing. Whatever the latest fad
in "management", "quality", or "customer service" is, it becomes
educational doctrine. What's being taught depends on which "cheerleader"
is currently popular and that changes once their popularity fades. (Am I
imagining things, or does that time period seem to be getting shorter
lately?)

In all of this, what seems to get lost are basic fundamental concepts.
For example, in mechanical engineering and mechanical engineering
technology, one should have a good grounding in topics such as dynamics,
fluid mechanics, heat transfer and thermodynamics, and strength of
materials. Once that is established, then one can build on them and
proceed into more advanced material.

It is these concepts which help make an *education* rather than
"training".

Under Part 95 operations ("private" the Pilot In Command has the authority
to authorize electronic device operation in flight.

Under Part 21 operations ("air carriers") this authority lies in the
"operator" which is the airline, not the pilot.

FYI.

This week, my company will be selling a Radio Shack PRO-2006 receiver.
The receiver has been used in an office environment to monitor fire
service radio channels. It is unmodified, and the case has not been
opened.

The receiver looks and works great. It is complete with telescopic
antenna, user's manual and factory service manual.

If you are interested in the PRO-2006, please email me. The price is
firm at $300.
This includes shipping, insured, to your address within the continental
United States.

Message-ID: <873059717.16180@dejanews.com>
Source record: 167134

Hi All,

On the Alinco dr-110, one is able to receive two other bands. 340-370 and 900 Mhz band. On the Alinco dr112, one can press the function button and then the Mhz button, and display these bands aswell. I know they do receive the bands on the dr110, while the dr112, seems only to display them. One can dial up and down the bands, but the receive seems/sounds dead. At first, I spent a great deal of time scanning these bands. I believe, The folks at Alinco, changed something on the dr-112, So it would not be able to receive them.

My question: Does anyone know what was done to change this, and how one might restore the receive for these bands?

I've never seen a Skem-diagram, for the dr-110. Perhaps, something was leftout or blocked in the dr-112. So maybe, it's just a matter of unblocking, or adding something to the dr-112, inorder to restore the receive for these bands.

I would very much appreciate any help/input on this matter.

Thank You Very Much! ... in advance.

I bought one last week. $20 at HRO for this apparently genuine virgin vinyl gem. I'm kind of fussy about cases, but this one is not bad. It adds just enough bulk to the VX-1 so you won't confuse the rig with a vitamin pill and accidently swallow it. The case also takes up some of the space between the rear cover and the belt clip, creating more friction when worn on a thin belt, which is good, because it helps prevent the rig from falling into the sewer every time you get out of the car. Also, I think the case is pretty essential in "case" of accidental dropage, which is gonna happen sooner or later. On the con side, there is a semi-scored outline over the dc input jack, but no actual cutout. You have to do that yourself, or else pry the rig out of the case every time you want to charge it. But if you've got a sharp blade and a steady hand, you can end up with a neat-looking cutout. Bottom line: a good investment and one that doesn't look cosmetically dumb. Go for it. (Besides, sooner or later you're gonna sell it anyway, so you might as well keep it in mint condition for some poor chap who doesn't realize how annoying it is to scroll thru nine bands before being able to listen to the frequency of your choice....Thanks, Yaesu...and may I recommend DECAF for your programmers?).

Andy,

Maybe they can use it to reflash the firmware? At any rate, I have my
doubts too.

I have a Sony ICF-PRO 80 shortwave for sale. It receives 150KHZ to
108MHZ continous. This includes AM broadcast band, all shortwave
(including all amateur shortwave bands), VHF low, cordless phones, and
FM broadcast band. Modes include AM wide & narrow, FM wide & narrow,
LSB, USB and CW. It includes case, manuals, antenna and connectors.
This is a digital receiver with 40 memories. I am asking $200.

OK...I come from a long history of reporters and scanners and that is what got me into amateur radio...

Will the VX1R perform as a good scanner...I know it has the coverage but does the bank setup lend itself to different banks for different services???

tnx...cleve/wd5bor

4571. Need: Heath IO-10 schem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-08-31 00:00:00 UTC
From: Larry Tucker <sts@ac.net>
Message-ID: <340A268E.5015@ac.net>
Source record: 167154

I have a Heath IO-10 monitor scope. I need a schematic diagram or copy of same. Copy of the manual would be good but I think I can do with just the schematic. Seems that the CRT is good but the socket has come off the CRT due to age and cracking of the glue that holds it on. If you have a manual and can copy the schematic I will gladly pay your costs.

Thanks much.

Battery Network offers a replacement for the IBM laptop. Though I must admit the performace was only a fraction of the original factory battery. Like so much these days, aftermarket and generic replacements are usually a poor performer and often give products a bad rep when someone uses the aftermarket batteries with a otherwise high quality product.

Message-ID: <01bcb6e3$a8b81900$914445d1@mcsppro200>
Source record: 167016

Ed:

It appears that most GMRS equipment includes the operating frequencies of FRS. Motorola, Maxon, Uniden, mfg. GMRS radios (probably some others), as well as FRS. Tandy (Radio Shack) appears to have backed out of the GMRS market and currently pushes FRS, as the previous message indicated.

Bill Crocker

p.s. Several amateur H.T.'s can be tricked out-of-band for GMRS or FRS, but doing so is illegal due to FCC type acceptance, licensing, and in some cases, power output. Yeasu, Icom, Kenwood, Alinco, etc.

Mint condition Kenwood TS-830S HF transceiver. Comes with
MC-50 microphone, instruction and service manuals. Cleaned
and inspected by ham shop 2 months ago. This is a solid state
transceiver except for the driver and finals tubes. Covers
all HF bands including WARC. The receiver section has all
the bells and whistles you might ever need. Variable bandpass
tuning, IF shift, notch filter, RF attenuator and RIT.
Every new HF transceiver under $1000. doesn't have half of these
features. It has a solid 220 watts PEP on SSB and 180 watts on CW.
Additional CW filters can be bought to make it a serious CW
contester's rig. The SSB transmitter section has VOX,
adjustable compressor and adjustable sidetone. I am selling it
because I want general coverage in the receiver.
The asking price is $450. and that includes shipping
anywhere in North America. Contact me by email if you
need more information or are intrested.

73 de VE2CJW, Michel Morin Quebec, Canada.

My guess is that they want to broaden their business. They want to move into the appliance business against Best Buys but lost their shirt with The Incredible Universe (Much too big). Now they will go with a smaller store, TECH America. If this takes off, look for Tandy to merge Radio Shack into TECH America. The Radio Shack name has too much baggage.

TECH America: 800-877-0072 or http://www.techam.com and the catalog is free (no minimum order).

Not going to be too satisfactory. When the '980 is "captured" by the
CAT software, it cannot be operated from the front panel but only by the
software.

Check out the new Web site for San Francisco Liberation Radio at 93.7 FM. We broadcast seven afternoons and evenings a week without license from the government. We feature revolutionary music, radical talk shows, uncensored news, and children's programs--the kind of programming that you will not hear on government licensed radio stations. The Web site contains a weekly program guide complete with program notes written by our broadcasters, who specialize in topics such as social justice, government corruption, the environment, animal rights, poverty, homelessness, police brutality, prisoners' rights, etc. Locally produced original programming! No commercials! No corporate support!

Dick:

Command or Charge, I don't exactly remember, just remember PIC. Anyway, the PIC has the authority & responsibility. But having that, it certainly doesn't guaranty smart decisions. Recall the Dubroff tragedy; high altitude departure, heavy load, bad weather, gotta make a schedule. My point is that, as hams, we ought to be smart enough to not try to use our electronic equipment in the sensitive environment of an aircraft, no matter what regulations give whoever the authority to tell us it's OK to play.
EMC happens to be my professional specialty, and even I would be hard pressed to make a judgement about the safety margins involved. Do you really think the PIC can guess the 5th harmonic radiated emission level of your 24 MHz system clock? And whether your clock harmonic will interfere with, say, San Diego's approach frequency 35 miles out from the runway?
As you descend into the coastal fog, sliding from sunlight to zero visibility, that PIC is damn busy. Things happen fast, bad things happen even faster. And Vart thinks it's reasonable to add to the excitement of this moment, just so he can use his scanner. The arrogance is astounding!
Finally, everything I said applies equally to the "airline", as well as the PIC, not being competent to make this judgement either.
I believe that there's a working committee (of SAE?) now trying to establish rules for in-flight passenger electronics. So far, lot's of

scary stuff about the variations of fuselage shielding, pickup of interior cabling, leakage of RF through windows and other apertures, etc.
In case you haven't guessed yet, my judgement is that no electronic equipment should be operated by passengers. For the sake of umpteen megabucks of aircraft, several hundred other humans, and, not the least, your own carcass, isn't it possible to refrain from hobbyist activities for just a few hours?

>
>
FRS is here and promises to be around for awhile. The typical amateur radio UHF rig would be easily modified to cover the FRS frequescies however the technical standards are much tighter. Frequency tolerance must be held to 0025% (roughly +/- 500 Hz), deviation is limited to 2.5KHz vice the typical 5KHz for amateur use and audio must be filtered to eliminate response above 3.125KHz. Since the frequencies (14 of them) are sandwiched in with the GMRS freqs, any deviation from these limits is sure to be rapidly reported. GMRS people were not overly thrilled with the birth of FRS. In addition, the FRS rig is limited to 0.500 Watts and the antenna must be unity gain and an integral part of the transmitter. The FCC is very explicit on the FRS rigs meeting technical standards. Any rig operated in the FRS MUST BE FCC TYPE ACCEPTED. Hope this answers some of your questions.

HAM GEAR FOR SALE

Communications Specialists TE-64D PL box - BRAND NEW!
------------------------------------ $125.00 including shipping

4 Motorola MT1000 HT's - 5 Watt - 146-174 Mhz. band - 16 channels,
can program the frequencies and PL's that you want - absolute
MINT CONDITION - each comes with antenna, belt clip & battery --
$450.00ea/incl shipping

I have aproximately 25 Motorola HT-600 portables available for immediate sale.
These HT's are 5 Watt, 6 channel, 157-174 Mhz. bandsplit. I will have them
programmed to your frequencies and PL's as you specify. I also
have a few speaker/mics, six-bank chargers, some single rapid
chargers, and a few other accessories for these radios. I will sell
these accessories with purchase of radios only! Radios
are all in excellent condition, and come complete with
battery, antenna, and belt clip or drop-in holster. Price is
$325.00 each incl shipping. Please Email me for quantity pricing.

CQ Magazine - August 1995 issue - $2.50 including shipping
CQ Magazine - Sept. 1995 issue - $2.50 including shipping
73 Magazine - Oct. 1996 issue - $2.50 including shipping

4599. Cleartone CM6500 UHF Transceiver - Information?

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-01 00:00:00 UTC
From: Eric Warner <eric@northop.demon.co.uk>
Message-ID: <CEG6uCAaJyC0Ew4J@northop.demon.co.uk>
Source record: 167032
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Hello All,
I've just bought one of the above radios at a rally and was
told enough about the keypad programming to determine that the set
works OK on it's original 450 - 470Mhz channels.

I now want to mod it to the UK 430 - 440Mhz amateur allocation and
wonder if anyone has done this before? Simple re-tuning doesn't look
like the answer as the local oscillator gives up before it gets down to
the 70cm band :-(

A web search has drawn a blank - even on the "Cleartone" company! - so I
wonder if anyone out there has wrestled with one of these sets before?

TIA,

Eric

No, because knowing radio shlack, the rig couldnt be modified for CB
use.... :) I mean, look at the HTX-100 or whatever the hell their
10 meter rig was, even though it is modifiable, it still only does CW
and upper side band- and for chicken banders, those are probably the
two LEAST used modes.......

Go to any ham radio store or Ham Radio Outlet and get the latest
ARTSCI book, the kenwood version, on modifications. Sure, its a
pricey way to get a mod, rather than just looking around for it, but
in a pinch its about all you can do.

Not worth it, pretty much a piece of junk..... I mean, if you like
having rigs that restrict operating modes, fine..... But any of those
radios arent worth more than $75, and probably $100 if it was in "new
in the box" condition. For roughly $150, you can get an all mode
HR-2600 that has the rest of the modes, plus repeater capability, and
even a PL encoder.

I also have to echo the praises of the 1000MP. Have been running mine for several months. The EDSP really works. Am getting good reports on audio. Also like the matching mike. Gives you good control over the highs and lows. Autotune works well. Noise blankers (2) work very well. No problems at all. Watch for a used one, you can save some money.

>
>Thanks
>KF4RNK
>

Well, the TM-V7 is superior- you just get plain more for the
money that is put down. PL decode, page, etc, blah blah. Actually,
theres a BIG feature on the TMV7- direct entry, which the 8100 does
not have. There also is the MIC control feature, which is nice, but I
keep it off, as it is buggy. (there are a few software bugs in the
TM-V7, but the average joe wont run into them under normal use- they
were spotted by a fellow ham who explored the whole radio and used ALL
of the features- which is something I never do.....

When it gets down to performance, the radio has a great reciever. As
far as intermod goes, MAYBE the 8100 is better- although I have yet to
take my 8000 into boston. (same radio, just no detachable face) Right
now the 8000 is at Yaesu getting repaired.....

The only real downside that I've noticed with this radio is that the
display washes out in bright sunlight. This really isn't a problem
provided that you find the right location in your vehicle for it.

: schools, to meet their (very) short term wants (wants, not real
needs).

A good commentary.

I must agree with you on industry being out of touch and concentrating
too
much on the short term. I'm finding that the "alliance" between schools
and industry may not necessarily be a good thing. Whatever the latest
fad
in "management", "quality", or "customer service" is, it becomes
educational doctrine. What's being taught depends on which
"cheerleader"
is currently popular and that changes once their popularity fades. (Am
I
imagining things, or does that time period seem to be getting shorter

lately?)

In all of this, what seems to get lost are basic fundamental concepts. For example, in mechanical engineering and mechanical engineering technology, one should have a good grounding in topics such as dynamics, fluid mechanics, heat transfer and thermodynamics, and strength of materials. Once that is established, then one can build on them and proceed into more advanced material.

It is these concepts which help make an *education* rather than "training".

I did both the marketing/promotional video and the training video for Yaesu on the 1000-MP. They don't pay me to say nice things about their products! Often when I'm doing product videos for customers, I wonder how they sell their stuff with so many obvious shortcommings. Not so with the 1000MP, clearly the finest piece of amateur gear I've ever used, and I've had ;em all!
Other than some somewhat ambiguous explainations in their manual and also some outright mistakes, which I believe have been corrected since my xerox copy, the FT-1000 MP is an outstanding performer. I might also mention that I also just did a piece on the FT-920 and if you don't have the $$$ for the 1000MP, the FT-920 is a fantastic bargin!
An CW ops with an FT 1000-MP interested in the contest keypad controller, I have a brand new one (never opened) I will sell real cheap.

Many thanks to the Japanese/English speaking Ham who translated the
Icom 746 Brochure that was handed out at the Japan Radio Fair last
Saturday.Here goes:

HF to 2 meter radio,100 watts,50 watts with features
-all mode in all bands
-2 meter 50 watts
-includes PBT(pass band tuning),APF,VOX,Various filters,all mode FSK
-key down transistor finals
-keyer included
-tuner
-includes general coverage receiver
-visible display of signals on the SPECTRUM SCOPE is much faster than
on the Icom 756
-100 Memory channels
-noise blanker
-auto DSP circuits for noise canceling,notch,passband

Thats all Guys !
73's NS1R Steven Hershman

> My neighbor brought over his ICOM IC-2A (no touchtones or subaudible
> tone capability, no belt clip, carrying case or hand strap-it is
> average cosmetically and both halves of the case are cracked on the
> right side) for me to repair.

Sounds like poor condition to me.

> It has a normal sounding receiver (audio
> and squech work), but receive sensitivity is way down (a local
> repeater that is normally DFQ on a rubber duck is barely audible and
> very noisey even when an outdoor ant is used).

> Further, the tx power is low-it barely moves my power meter, well
> under 1 watt-in the low power position, the output is ZERO-doesn't
> even make the meter flicker.

The power out is 150 miliwatts. This is the low power setting. If you get 150 mw from the high power setting (most likely in this case), he blew the final transistor. Full output power is about 1.5 volts with a fresh battery or car cord (voltage reducing/current limiting model).

The ic-2a had no current limting circuit so running it at a higher voltage than the aproximately 11 volts specified as the limit will cause the final to go. Simple repair, it's a small transistor in a metal can with 3 wire leads. It's easy to identify, it's the only one soldered directly to the metal frame.

Last quote I had (in the U.S.) on the transistor was $30, but I expect they can be had for less.

The final tranisitor will also be destroyed by operating it with an swr that is not near 50 ohms, such as a shorted or open (empty) antenna lead.

> I learned that the failure happened after he operated the unit on an
> improper voltage battery pack that wasn't made for the radio-so, it
> has been exposed to an over-voltage condition.

> I advised my neighbor to write off the radio

Good advice.

> He suggested that it should have some re-sale value, he paid good
> money for it.

> So, it's forsale. AS IS.

It's really only good for parts. The cost of a service manual, the final transistor, fixing the case, and what ever died in the RX would add up to more than it is worth. If you expect to be paid for your time, even just a case of beer or a bottle of scotch, it would definately not be worth it.

In tip top condition, $100 is a lot.

If it really does transmit and receive (although poorly) on the correct frequency, and the frequency tracks the thumbwheel settings, then the micro-processor and PLL are good. They are hard to get parts, but require expert desoldering to be of any use.

> Have 2 battery packs, believed to be good, and the stock wall charger.

Probably not. If the radio was that beat up, the packs are probably cooked. They are held together by screws, it's easy to open them up and look for signs of leakage.

The charger is not worth much either, I replaced mine with a generic for less than $3, here in the land of 60% import duty and 17% sales tax.

Sorry,

73,

Geoff.

> -Mike

A friend, who is into the illegal CB scene, took me to a truck stop in northwestern Indiana where they modify radios. First, I was very impressed with the technical knowledge of the kid doing the mods. He was also a very good craftman. Most impressive was that he had no formal education. I wish we had that level of expertize in amateur radio (I know to many hams, general and above, who could not do what he did).

The radios that they are modifying are not ham units. Most of these folks want features that ham gear does not have, like reverberation and a beep when you let up on the mike. The Ranger is preferred over Uniden (I didn't know that Uniden has a 3500, 100W unit). But Cobra is liked better because of all the "bells and whistles" (literally). Believe me, CB has really gotten off the deep end. I don't think we need fear them. They want their own world (frequencies), look down on us and are generally doing things that would make us shake our heads. Their frequencies are going lower than 11 meters (their radios are set to that), they want to move away from us.

I think that most of the comments I hear from hams are based on
experiences from the seventies (like everything else in ham radio).
While I find much of what CB does to be weird, I do not see them to be
the threat that hams make them out to be. Our threat is mostly ourselves
and to a much lesser degree, government.

Hi Squak,

I just went ariund with SCG on this issue... and yes it should be mounted out side of the car/truck. I lost two control heads because the ATU radiaed inside of the utility Vec. I also received RF gurns from the car body. You are correct that the antenna starts at the ATU... by placing this wire insulated through the body of the car, in my case a capasitive coupel was made to the car..... ZAPPPPP

The truth is that education today is driven by the dollar. Industry has a direct impact on what/how an education is delivered, and this is not going to change. With the cut backs in government funding to education many of the institutes have to find business / communitee partners who will donate money, expertize to the process.

Government today is pushing very hard for "pretrained" employees. Everyone is forgetting that education at the college / university level was never intended to be a "skils" enviroment. Graduates from university should be given the broad base knowledge that they can take to an employer and "grow" into a position. Today we are forced to produce a "clone" who is supposed to be able to walk out of the halls of education and do the job.. An impossible task for anything beyond the base levels.

> tnx...cleve/wd5bor

No. The VX-1 is annoying as a scanner. It's "BANKS" are really different frequency bands, rather than collections of user-programmable multi-band frequencies within a specific bank as you are probably used to with a true scanner. You might be happier with the little Standard C508A, which can accommodate mixed-band frequencies consecutively in memory, and whose 800 MHz sensitivity is far superior to that of the VX-1.

____
You miss my point. If they modify it, no problem. I'm afraid they
wouldn't, and we'd find them all over every HF band.

>going to change.

So close.... and yet so far. You are correct, education is driven by the dollar, education is a business. BUT..... it is not industry that controls the quality and nature of education it is the *CUSTOMERS*. With tuition running in excess of $15,000 per year at many US institutions it is not industry dollars that are in control. Which was my origional point ten thousand posts ago; the student is the customer and should demand to be treated as such and should negotiate for whatever services they wish to purchase (which may or may not include a degree). We have no none to blame but ourselvs for the state of things.

>With the cut backs in government funding to education
>many of the institutes have to find business / communitee partners who
>will donate money, expertize to the process.

The money that comes in from tuition and other student fees is more than sufficient to provide the basiscs of a good education (classroom space, faculy and staff salaries, etc.) It is not enough to fund unlimited expensive research projects, excessive administrative overhead, and other services offered by the typical univesity that are of no particular use to the students. Augmenting the financing situation through alumni donations and charitable contributions from industry may not be in the best interest of the student body but it is definitely in the interest of the school administration who gain control of these extra funds.

>Government today is pushing very hard for "pretrained" employees.

<snip>

Electronics expertise? Most people doing mods don't know anything
except how to read a cookbook. I'm not impressed. Now, designing
and building something is something else. I have unfortunately gotten HF
gear that had been modified and it was a mess. The power meter function
was adjusted so that it indicated twice the power or more than it was
really putting out. And the ALC cranked up to the point it really was
not working and it produced splatter for 50 KHz or more. Sure it was
indicating three times the output power than spec.. But the output amplifier
was saturating as well. It took some time to undo the mods in this
FT707 and after getting back to spec it went to a young novice operator.

>I don't think we need fear them.
>They want their own world (frequencies), look down on us and are
>generally doing things that would make us shake our heads. Their
>frequencies are going lower than 11 meters (their radios are set to
>that), they want to move away from us.
<snip>
Too often people confuse these illegal operators with hams,
many don't know the difference, when there are problems. We also have
many hams that are illegal operators as well. Operating out of
band and way over the power limit for CB.
If they are not operating within the rules of Citizens Band
and are out of band or running amplifiers they are not CB operators. They
are illegal radio operators. It is as simple as that.

At&t world net policy,

I had them for 3 days,I had truoble reading the news groups would not load them all I spent 10 hours on the phone before I said forget it. At&t NEVER FIXED MY PROBLEM.I ended my service with them on july the 12. The rep told my that she was sorry and there would be no charge that was 7-12-97. AT&T billed my credit card on august 25 for $46.81 So people beware of AT&T worldnet. AT&T is to big there customer service is spread all over the U.S. and you never get the same tech to help you. After billing me when they should have not I called them to find out what was up, The rep told me it was there mistake and they would credit it to my card, THEN SHE SAID IT WOULD TAKE 45 TO 60 DAYS TO DO SO!!!!!!!!!!!!!!

I hope that all my scanner friends take note, Customer service like this is not good business at all. Maybe this post might help stop someone else from making a BAD mistake and going with AT&T WORLDNET.

happy scanning,

B.S.policy wrote alot of red-faced dribble about At&t world net policy,

Let me first preface this with.....
I have been an AT&T WorldNet customer for over 2 years with impeccable customer service and very responsible responses to my queries. I have gone thru 2 upgrades and 2 computer changes with them requiring the loading of their software on new machines. I would recommend them as an ISP any day to anyone. Including my mother (hi, hi)!!

> I had them for 3 days,

a real and well-rounded test period, I guess !!

> I had truoble reading the news groups would not
> load them all I spent 10 hours on the phone before I said forget it.>

Frustration makes the timeclock move quite slowly ... 10 hours on the phone... AMAZING!
Even 3 hours per day for 3 days, still an amazing statistic.

> At&t NEVER FIXED MY PROBLEM.I ended my service with them on july the 12.
> The rep told my that she was sorry and there would be no charge that
> was 7-12-97. AT&T billed my credit card on august 25 for $46.81

SIX weeks, my, what might have happened during that timeframe .. at least that can be documented, much unlike "TEN HOURS ON THE PHONE"

> So people beware of AT&T worldnet. AT&T is to big there customer service is
> spread all over the U.S. and you never get the same tech to help you.

You do, if you ask their name and extension number.

> After billing me when they should have not I called them to find out
> what was up, The rep told me it was there mistake and they would credit
> it to my card, THEN SHE SAID IT WOULD TAKE 45 TO 60 DAYS TO DO
> SO!!!!!!!!!!!!!!

OK, the same time frame it took for you to discover the billing discrepancy. Did SHE say that it would take that long to take action, or that long for YOU TO SEE the amount adjusted to your bill. Remember, credit cards only bill once a month.

> I hope that all my scanner friends take note, Customer service like this
> is not good business at all. Maybe this post might help stop someone
> else from making a BAD mistake and going with AT&T WORLDNET.
> happy scanning,

I hope alot of friends see this. With your rant and rave, I would not want any of MY friends to see this reaction (like a timebomb) to a very minor incident. FWIW, I have similar experiences with 3 other ISPs, but did not take it public. I did take it to their customer complaint department and it was settled at that level. There are thousands of happy customers with hundreds of ISPs. Do you really think that your one BAD APPLE incident will change the minds of many, or any?? I would like to see the records of AT&T as to how you acted (note, not reacted) during your service call to them. Granted, any professional helpdesk worth its salt will do its best to satisfy the customer. But, when the customer begins with an attitude, it is very trying for the best helpdesk professional to handle a difficult customer.
I do not work for AT&T or any communications company, but I do work at a helpdesk and deal with customers all day long. (when not on break)
I can only feel compassion and empathy for whomever your current ISP is. And pray that you get all of the luck in the world, preventing a similar rant upon their customer service department.

Let me share with you all what are the known problems with this radio. I have one, just bought it and two of these issues effected me. I really like the radio, so I'm going to keep it, but for those that are interested here is what I know!

1) Radio has low audio when in X-Band Repeat mode on the U to V scenario. Fix is send back to Yaesu and have then add the parts. Or, if you are really good at surface mount stuff, I got them to fax me the update. BTW, it does appear that Yaesu fixed this problem in production as the two that I have had didn't seem to have this problem.

2) Radio will continue to stay transmitting once you let off the PPT. Fix is some bypass caps, but I don't have the sheet yet from Yaesu. It doesn't appear that I only have this problem, but read below for rest of the story.

3) It seems this one is a new one. And this gets really wierd, but it works like this. If you transmit on a 440 freq the 2mtr side will hear it. I tried this on 6 radios and it doesn't matter if you use a dummy load or real antenna. Try this. Set the UHF to 443.025 (my repeater outpuf), and then set the VHF freq to 146.555 (nice simplex freq). Now set the squelches to the ragged edge. Key the UHF side and see if the VHF will open each time the UHF is keyed. It might not at first, but hold the key down for a few seconds maybe even a minute. and see if you have this problem. BTW, it doesn't appear to be birdy related, I could select 144, 145, 146, etc and it would still do the same thing. Funny thing is, if you remove the top on the radio, it will not do this. It also get's into the audio circuits as you can hear audio but it doesn't not match the audio that would be coming from the mic. Really wired one here. I just got off the phone with Yaesu on this one, they are investigating.

I just thought I would share this with all. A couple of other notes.

1) I checked the sensitivity of the 8100 vs a kenwood 733 that I have, the 8100 was slightly hotter, but not by much. so I wouldn't be too concerned about the performance of this radio. I really like the features. It's the only Dual bander that I have owned that will let you have complete control over the radio when in x-band repeat mode. You can pick up the local mic and have a conversation, change freqs, change pl's etc. It has true x-band, you don't have to select the operation side first. OR you can have 1way repeat if wanted. 800mhz rec worked just fine and with software you could trunk track if you wanted. I plan to play with that. I have the trunk track software with source and should be able to drop in the Yaesu programming to chase the 800 mhz stuff.

Except for the couple of warts, I'd give this radio a thumbs up. I can fix the 2mtr side issues with the pl decode module for now and I'll bet they

get a simple fix for that, probably some filter caps, etc. My guess is the TX staying up and the 2mtr opening when tx'ing on the 440 side are related to some stray RF that didn't get filtered properly. Only thing that would have been nice would be to have had ASCII tags for the memories. Oh, well, probably took the memory space and allocated it for the 208 in stead of the 100ish memories on the 8000.

All in all, a good purchase!

BTW, I do have the official MARS/CAP mod, but would be interested in any others. Anyone seen a service manual yet?

Thanks,
Alan Adamson

Can any of the amateur HT's be modified to RX/TX in the 462-467 FRS frequency range? I would like to purchase an HT to use both to communicate with FRS radios and under a license with amateurs.

If this has been covered before, please point me to a FAQ file, or e.mail me privately. Thanks

Source record: 166973

I need some help from more knowledgable owers of the ft-530.

I have a power adapter (dc powers plug that connects to battery terminal) what I need to know is can supply more then 12v safety through these terminals. The external power plug will accept up to 16v is this rating the same for the battery terminal.

Any help would be appreciated

>
> Thanks
> Greg KB6WKW

Hi Greg:

I think the first two might be capacitors. The values being 102X10^-6. The second unit having a 1KV rating. The manufacturer is likely ERIE (not frie).

MR usually indicates Motorola Rectifier. "M" is the Motorola symbol. The 7426 and 7412 are date codes interpreted as 26th week in 1974 and 12th week in 1974.

IR was International Rectifier. The X5M4 is likely a proprietary designation.

I hope I'm not a source of too much confusion for you, Greg.

73,

Gary, K9HDU

4678. Re: FS: YAESU 736 6METER TRANSV.

Steve,

If I'm not mistaken, the Icom 736 has "native" HF + 6M, so why would
anyone need a transverter for it? Maybe there's a typo at work here??

4679. Yaesu, are you listening!!!?? Yaesu did it again!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-02 00:00:00 UTC
From: Andy Zorca <wj9jrg@utc.campus.mci.net>
Message-ID: <340CCECB.38C9@utc.campus.mci.net>
Source record: 166986

My biggest complaint with the 8100 is the lack of audio (The FT-50 HT puts out more DBs on a level meter) And the lack of audio fidelity, and the lack of a wide band IF for TV audio listening! And poor TX audio (compared to their 5100, 5200 series).

Yaesu, are you listening!! Just like the VX1R. Great features, poor audio. Now if you could just give the VX1R about 2" and 1 oz more for a speaker like the FT-727R. Then you would sell lots! (in fact, thats why Alinco sells as good as they do, They don't last as long, have poorer repair histories - but great audio).

I like the amateur radio "Standard C510A" as featured 1-watt duel bander and scanner with 200 memories and 20 banks. It also has 20 search banks. The C510A may not have TV channels, but it has most everything else.

Hi Garry,

Sorry but I forgot to configure the email program. It might be my
little brother has been playing with the configuration. I will use the
mod for professional purposes. I use the radio for marine purposes
also besides the hobby.
I will receive the radio at the end of next week.

If you have any info on the modification, you can send it straight via
email to on4aes@mail.interpac.be

Best greetz, and see u maybe on the air.

4689. ** Need RFI Help: Symphonic TV/VCR Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-02 00:00:00 UTC
From: wb4lnm@aol.com
Message-ID: <19970902110700.HAA12903@ladder01.news.aol.com>
Source record: 166996

I have a Symphonic TVCR13B1 combination TV/VCR (that has been talked about much on this forum). Problem: The switching power supply that stays on at all times when the unit is plugged in creates SIGNIFICANT radio frequency interference to my amateur radio HF receivers. Enough so that I have to unplug the TV when I am operating, which with this TV, causes it to lose all of its channel programming. The interference is coming in via the HF radio antenna, not via the power line of the HF receiver.

Some time ago, I placed a standard Corcom RFI line filter module in line with the sets normal power cord, but had no success in reducing the interference. I also tried taking a one-half inch diameter by ten inch long ferrite rod and winding the line cord around this, which did not seem to help, either. It is very difficult to tell if this noise is power line conducted or radiated directly from the set. The schematics indicate that the TV has two sets of line filters (L1001/C1001/C1036 & L1012/C1040). I hate to go to the step of building shields for the PS if it is not really radiated from the board. Does anyone have any thoughts on reducing the RFI at the source (unplugging it is sometimes not an option!). Given that this set has a semi-hot chassis, finding widespread really good grounding points is difficult.

If so, please respond here and / or to : WB4LNM@aol.com

Thanks

John...
WB4LNM

From: bd703@scn.org
Message-ID: <EFuyK9.Cu2@scn.org>
Source record: 166999

Can anyone tell me what value the resistor in series with the rx audio IC V+ pin is? A friend just got his working again but he bypassed the resistor, which was installed by cutting a trace and jumpering the cut with the resistor. He didn't have the circuit diagram at the time.

I know the IC-27A uses the same IC amp and has a (4.7 ohm)? resistor in series with the +13.8 VDC, as well as an electrolytic bypass cap.

Without research you cannot hold on to a lot of good faculty members, or
successfully recruit good new faculty. You *need* faculty to teach
students.

Some institutions do have programs where undergraduates do participate
in research, which can be of great use to a student. At many European
institutions, this is the norm.

Doing away with research at all US universities would be a huge mistake.

Like it or not, the current system *does* work for lots of people.
People come from all over the world to attend US universities. It didn't
work for you, but no system will work all the time for everybody. Part
of the function of a school is to weed out those who cannot (for
whatever reason) do well. Those that get weeded out are probably never
going to like the experience.

Basically tearing the system down, as it seems you want, would be a
mistake of enormous proportions. If (more likely when) your new system
didn't work, we'd be completely screwed, and left without any decent
higher education system.

I like what the Germans do. University is for the best of the best, those
going for Ph.ds. Business/technical schools do what our MBA, business and
engineering/technology programs do. We lump everything at the university.

What we should do is seperate professional programs from the undergraduate
degrees. Already several professional degrees are offered only as post
graduate degrees (medicine, law, MBA). Why shouldn't engineering, teaching

and the CPA be at the graduate level? Most top engineering schools are heading that way. Just combine the junior, senior and masters into a 3 year Masters degree. Let the undergrad program be either an Engineering Technology or physics degree. Engineering technology (EET, MET, etc) are very applications oriented rather than R&D like an engineering masters. And if a kid is only in engineering to get into technology management, a technology degree would be better.

I just helped someone clean out an old ham shack and I brought home some old radios. I would like to get any info on them and maybe some manuals. I am mostly into CW and may be interested in trying to get some of these old rigs operational.

Here is a list of what I got (please post or email comments):

- Collins Receiver 75A-1 (S/N 1415)

- Collins Transmitter 32V-2 (S/N 1133) I am unsure of the model number it may have been 82V-2.

- Collins Recevier COL-46159. It is the receiver portion of a Model TCS-12.

- Heathkit Transmitter Model AT-1. This is the one I intend on getting operational first but I will need to find crystals for it.

- Atwater Kent Model 40

- A Magnavox Dynamic/80 speaker (attached to the Atwater) This may be garbage because the speaker cone is ripped.

- A box of 6 meter crystals.

Does anyone know if when you do the mod (ex.remove the 6th component
behind thefront panel). That when you reset&reprogram the radio you
lose all the channels you put in? So you havechannels 1-50 that you
can dial in?
And with explanded tx mod does the antenna need to be retuned or do
I need a new one.
Are there any more mods for this radio like cellular fregs
Thanks

<<Graduates from university should be given the broad base knowledge
that they can take to an employer and "grow" into a position.>>

Amen!

<<Today we are forced to produce a "clone" who is supposed to be able
to walk out of the halls of education and do the job.>>

Fortunately, some engineering schools give the broad base knowledge
that their students can take to an employer and "grow" into a position,
and some companies hire graduates who have good base knowledge and who
will grow into positions.

My experience has been that "hands-on" schools tend to train graduates
who can go into industry and operate the latest instruments. During the
next new years, as instrument models are up-graded slightly, those
engineers (at least the ones who keep themselves current) learn to use the
new instruments. But eventually, new principles replace the older
principles, not only behind the instruments, but behind engineering
itself. Again, my experience has been that those "hands-on" engineers
tend to be so weak in physics and mathematics, that they have serious
trouble even in reading the instrument instruction manuals, to say nothing
of engineering literature.

The TM-V7A has a visual scan mode that allows you to identify adjacent band activity. With the PL tone scan you can identify a signal and then use PL tone scan to join the repeater.

Have you seen the heat sink chassis? It is massive and provides the best cooling efficiency, especially with the added fan on the back. The Automatic simplex checker mode is wonderful for checking the REV without pressing a button.

Advanced Intercept Point (AIP) helps reduce the intermod situations. Built-in duplexer, built in CTCSS, a voice synthesizer is an option. Alpha numerics for memory naming (7 digits).

The best part is that Kenwood is offering a $50 instant coupon for a limited time only. So if you are planning to buy one don't get caught thining about it, just do it!

Kenwood deserves a big attaboy for this long overdue change in
their thermal design. Too bad it has taken them this long, though.
Lack of adequate heatsinking has been a chronic problem with
Kenwood VHF+ equipment for many years.

I normally have very little good to say about Kenwood VHF+
equipment, but this one is a major step up from their general
pattern. The only thing I *really* don't like is the cutesy blue
display. It washes out much too easily.

Bob,

I bet you're sorry you hit the send button right about the time you reread what you typed. Actually the module for the FT-736 (that would be Yaesu not the Icom IC-736) is not really a transverter but an RF section to compliment the FT-736 front end. The Yaesu comes with 2m and 70cm built in and these modules are used to extend coverage to your choice of 2 more: 50MHz, 1.3GHz or 220MHz.

73 Jerry Happy FT-736 operator

My familiy has experience with the Vertex VXF-1 FRS HT's. Easy controls. Small shirt pocket sized package. They work with remote speaker/mike the kids put them in pouches where the units are protected. I prefer the simplicity and size to Motorola's. These little radios have been selling other families on the idea.

PS Dave (AH60B/4) gave you some good information regarding FRS and reasons why non-FRS transceivers shouldn't be used with FRS. You may wish to consider buying another one of those cute FRS units for yourself--the FRS is small, it will save your HT batteries and it will save your more expensive HT for other uses.

Can someone tell me WHY? Do I need 25 issues of each edition of QST sitting on the shelf?

I don't understand. There is the original (@theporch) boatanchors list, the "new" (a@Tempe) boatanchors list, a Collins Collectors Assn. list, a BA Swap list, and of course rec.radio.amateur.boatanchors.

I mean, I don't really give a d*mn because the few GOOD lists that exist are quite enough, but it seems a bit of a waste. And if I actually subscribed to all of these, I'd just see the same old postings 40 times instead of only 5. Perhaps there are more valuable things to do with one's time ....

A station like that would be better off skipping radio broadcast
altogether and instead putting all of the programming on Real Audio. That
way, anybody in the country with a cheap computer and a modem can hear it.
As we all know, there are no regulations for the net just yet.

> Is there somebody who knows how activate the PBT?

If your really meant IC-765 and not IC-756 then did you try pressing
in the button above the PBT tuning control? It's the one on the left
of the 250Hz filter button. The IC-765 does not have Dual PBT, so you
get no change to your filter shape. It's a pretty poor facility as it
knocks out one of your filters and badly damages the skirt rejection.

>Thanks in advance........
>Skip Tyson KE6YRZ

Yes it can, you need the 13 pin to 7/8 pin adapter pictured in the
manual then it's a no brainer. You can also wire the connector provided
with the 706 for the tuner. The 706 provides the bandswitching voltages
the AT-150 needs. Remember it will not do 6m.

Jerry

: Anyone got anything to say about either? What mods are available for
: both?

I don't know anything about the ICOM....but I do have an 8500. First,
it seems to be a good RADIO radio (i.e., no problem with intermod). I
do like the "potato-head" microphone concept, because you can control
everything without having to reach over to the radio. I do not think
that the implementation is ideal, but it is also not bad and is
reasonably thought out. I do think the joystick is mostly a gimmick and
the function could have been implemented in a more usable fashion. It
does its job, but could be better. This microphone DOES have a learning
curve associated with it, and is probably best for the "geek" market. I
doubt that it has been wildly popular, because Yaesu seems to advertise
it only lightly and has not come out with anything similar...

There is the other microphone option. You gain a smaller, less intimidating package, but the functions in general require more keypresses.

Anyway, I'm very happy with the 8500. Plenty of features (one-way crossband repeat is one that is notably absent, however), computer control option, ADMS programmability, good radio performance, make it a good package, even if it does have a few warts...

Subject: IC765

In article <340C908A.8EC4771C@domain.com> defaultuser@domain.com writes:

> Is there somebody who knows how activate the PBT?

If your really meant IC-765 and not IC-756 then did you try pressing in the button above the PBT tuning control? It's the one on the left of the 250Hz filter button. The IC-765 does not have Dual PBT, so you get no change to your filter shape. It's a pretty poor facility as it knocks out one of your filters and badly damages the skirt rejection.

From: Bob <cqbdiaz@pacbell.net>
Subject: My comments on the MFJ-418 Pocket Morse Code Tutor

If you wish to email me, please remove the letters "cq" from the start
of my email. (I put the letters "cq" so that the automatic email SPAM
programs will get the wrong address.) :-)

About 2 1/2 weeks ago I purchased the MFJ-418 Pocket Morse Code Tutor
for $80 from HRO. If a person is willing to spend 1/2 an hour to an
hour EVERY DAY studying with the unit, it can be a great tool for
learning code.

The unit is small and is easy to carry around. Thus, I take it with
me to work and practice during part of my lunch hour. At home, I
go to a quiet spot and practice there. The unit comes with a built-in
speaker, but will also work with an earphone or a headset.

I find the unit to be VERY flexable. I can set the practice speed in
1 WPM steps. Likewise, I can alter the tone if I wish to. Still, the
most important feature of the unit is the Custom Character Set.

I'm not very good when it comes to learning code. Sometimes I feel
like my brain is going into total overload. With the Custom Character
Set I can have up to 16 characters for practice. So, I try to learn
1 new character at a time.

For example, I know U, G, R, & P and I don't know V. So, I just select
those letters into the Custom Character Set and practice with just
those. If 7 WPM is too much for starting, I can set the speed lower.
However, after a while, 7 WPM seems too slow. No problem, I just set
the speed higher (and higher). Once I feel that I've learned the new
letter, I add the another new letter to the set.

While I wish the unit allowed for more than 16 characters in the Custom
Character Set, I can still work around this limit.

The unit allows a choice of Farnsworth OFF, 10, 11, 12, ..., 60. As well
as the character speed selection from 3 WPM to 60 WPM.

I spoke with a fellow HAM who has this unit. He was reaching a point
of giving up. He didn't know about the Custom Character Set feature,
so for him, each new group of letters ment learning 5 to 8 new letters
at once! I showed him how to use the Custom Character Set to learn
1 letter at a time, but I'll need to wait till next month's meeting
to see how he did.

For me the unit has been a big help in learning code.

Sincerely,

Bob KF6JHG

Subject: Ranger RCI 2950

Steve,

Go for it !! It is a very good radio. It's front is CB style and you
may find it fiddly if you are used to regular ham rigs but you will soon
get to love it. I find the receiver to be very good (better than my
Yaesu FT707)and can pick out and work stations below the static
threshold.The only thing it does not have is variable width filtering.

Jerry (the owner) of JCRE is also very good and can be relied upon to
get the radio to you quickly and in one piece. I hope this helps.

Sell or trade:

Heathkit HP-23B power supply. Nice clean unit in working condition,
with a copy of the manual. I can also include the 11-pin connector
that plugs into it, if you really NEED one.

The price is $75 -firm- and I will pay the UPS shipping charges.
Or, I will trade for a working Drake 2NT novice transmitter.

Have you tried putting ferrites on the DC lines from the
power supply to the TV circuit board?

Is the switcher supply enclosed or open-frame? You might be able
to fabricate a workable shield with aluminum window screen.

How about painting the inside of the case with conductive paint,
and grounding that?

From: tnic@IDT.NET
Message-ID: <5uk3oc$brr@nnrp1.farm.idt.net>
Source record: 166929

The replacement button is slightly shorter (about 1/16 of an inch) than
the original button. It does reduce (in my case eliminated) accidental
power on.

If you place the buttons side by side you can see one is shorter.

Also of you roll the face of the FT-50R on a hard surface it will no
longer turn on with the new button.

Good radio eh? The audio is loud and clear, runs up to 5 watts, can
be opened up with very little problem and its rugged.
Not perfect but better than most.

Dick

I think it all depends on the type of "Hands On" schools you recruit
from. If you're calling ITT Tech,
you're getting what you pay for.I graduated with a 4 year EET degree
from Wentworth Institute of Technology.
We took the same math courses EE's took (Calc 1,2,&3 and Diffy Q's),
Most of the Physics (Calc based 1&2, and Atomic),
and programming (Fortran). What we did forgo was the material science,
and chemistry. Each of
our engineering courses was paired with a lab course, where we used only
the most basic instrumentation
(Analog O-Scope, Counter-timer, VTVM, Etc.) to make measurements. It
seems to have given me an excellent base
to grow from.

A friend who lives about ten miles from here heard that I had a new radio and wanted to do side by side comparisons. The first night I took my Ten Tec OMNI VI+1 up to his place. The second night he brought his Yeasu FT1000 down to my shack. The OMNI sounded better, dug out the weak signals better and was easier to use both nights, on SSB and on CW.

Ten Tec sells these rigs with a 30 day return policy so you can make your own tests and see for yourself. I am in no way economically linked to Ten Tec. I have come to know and like some of the folks who make them. It is my opinion that the OMNI VI + is the best hf transceiver value on the market.

4745. Yaesu FLDX-400 FRDX-400 Twins

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-03 00:00:00 UTC
From: George@QNQ.Com
Message-ID: <873309619.18599@dejanews.com>
Source record: 166933

Twenty years ago I purchased two sets of Yaesu FLDX-400 / FRDX-400 twins just when the older tube equipment was being replaced by newer (better?) solid state equipment. Never really used them, just purchased them, boxed them up, and stored them away. Just recently I had both receivers to Yaesu for complete alignments. One receiver was the 'Duluxe' model what has (4) mechanical filters, FM, 2 and 6 meter converters factory installed. The schematic shows a copywright of 1971. My question is: Does anyone remember when these radios were 'state-of-the-art'? How did they compare to the competition (Kenwood T/R 599 Twins). What did they cost? And, what the heck is the difference between a mechanical and a crystal filter? (I believe that the new Yaesu 1000MP's use Collins mechanical filters. Are they better? Worse?)

I was told by the Yaesu engineer that these twins were quite rare, were not around for very long. Thanks in advance for any help in answering my questions and please respond via E:Mail, no need to clog the newsgroup with ancient history information.

4746. Mint Kenwood TS-830S for sale, second round!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-03 00:00:00 UTC
From: morinm@csgoeland.qc.ca
Message-ID: <873312762.22428@dejanews.com>
Source record: 166934
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

This is my second posting about my radio. I got lots of inquiries but a lot less serious offers. The TS-830S is a late model with GOLD lettering under the tuning knob, the serial number is over 2 million. The radio is in mint condition and comes with 2 microphones, one of them is an MC-50 mounted on a folding boom stand but the desk stand is also included. The other microphone is an Astatic handheld unit. I also enclose the instruction and service manuals.

The TS-830 is a base station radio, which means it plugs into a standard wall outlet. Its specifications put to shame every modern HF rig that sells for under $1500. new right now. It covers every ham band from 160 to 10 meters and also the WARC bands. It was Kenwood's Cadillac or flagship when it came out in 1981. It is all solid state except for 3 tubes in the finals. It has 220 watts PEP on SSB and 180 watts on CW. There are more controls in the receiver section than 3 modern low cost rigs combined. Which means there is everything you could ever ask for except DSP which wasn't invented yet in 1981.

The asking price is $450. U.S. and I will pay for shipping by surface mail and insure it for its full value. I hope that answers most of the questions you might have about this fine rig.

The reason I want to sell it is simply because I want to get a rig that offers general coverage in the receiver section and I don't want to buy a receiver, that's all. Please email if you have any questions.

Hi KC2CEX:

I have just ordered my first dual-band and picked the Icom T-7A for the price and ease of use. From the three I would go with the Icom W-32A(I would have picked this one, but I need more experience). The Kenwood is an older radio and the Alinco doesn't have an Automatic repeater offset. Well, good luck and hopefully we will be talking on the radio.

73,
Livio

Bought a $5.00 box of junk at a hamfest. ther were several RF power transistors in the box, All same kind. Would greatly appreciate if someone could identify.
What are the specs.
Thought they might be something I could use in an amp.

I've been told by Radio Shack folks that even though they sell the catalog, you can NOT use your Radio Shack credit card to place an order. Radio Shack also said, they can order anything from it FOR YOU. AND that's where they get most of their parts from as well. I too, got one. The selection isn't too impressive, at least parts wise, which is why I took it in the first place. I was looking for parts. The sales clerk was getting miffed at me looking at it, for free. SO I bought the damned thing.

No, I doubt they'd put many out of business. Not enough selection to start with. Prices are a bit debateable depending on how you look at it.

Just my 2 cents.......

For Sale:

1. I have a Icom IC-751-A for sale. This rig is as new,
"No Scratches" It is a circle i emblem, (Icom Emblem).

The IC-751A is a general coverage transceiver from 100 KC
to 30 MHz, 100 Watts plus out on All-Bands. Memorys,
scan, and keyer built in.(non smoker)

It is All-Mode, SSB, AM, FM, & CW.
I have shipping box, 12V cord, hand mic and book.

2. PS-35 internal power supply

3. IC-SP3 matching Speaker

4. FL-52A 250Hz CW filter

5. SM-8 desk mic.

IC-751A Transceiver $850.00
PS-35 Power Supply $125.00
IC-SP3 Speaker $ 50.00
FL-52A 250cy CW filter $100.00
SM-8 Desk Mic. $ 95.00

$1100.00 for all,

Plus Shipping.

I will only sell the PS-35, IC-SP3, FL-52A and SM-8 after
the IC-751A is sold!

Thanks,
Boyd N6DMF

Please take the time to look at some great audio tubes up for bids at eBay Auction web. I have 20 used/tested 7591. To get to the bidding page, just follow the following link for most browsers, the link will be in blue and you can click directly on it. The description at eBay is below.

Thanks for reading,
Christian Magee

http://komodo.ebay2.com/aw-cgi/ItemISAPI.dll?ViewItem&item=171478

This is a lot of 20 individually boxed, used 7591s. Each tube has been tested on a TV7 with excellent results. This is a rare opportunity to retube all of those Scotts and Fishers out there. The manufacturers range from GE to Westinghouse. There is a nice quartet of McIntosh 7591's in here. All of the getters (shiny part on the inside of the glass) look good. Winner pays additional shipping to anywhere in the USA. A reasonable reserve has been placed to insure a befitting final bid. For any questions feel free to email me. Good luck and enjoy the bidding.

4757. VX-1 Tip: Improving 800 MHz Reception!

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-03 00:00:00 UTC
From: Andrew M Cohn <andy@vais.net>
Message-ID: <340E1B4D.4CF1@vais.net>
Source record: 166945

You can enjoy a small but very useful improvement in the reception of the 800 MHz public service frequencies by simply wrapping the top 2.5 inches of the stock antenna in a layer of aluminum foil. I have observed up to a two S-unit improvement (according to the VX-1 meter), and in nearly all cases the aluminum foil made the difference between copying or not copying the station. For cosmetic purposes, you may then carefully wrap the foil with a tight layer of black electrical tape. This "mod" has not resulted in any really noticable degradation of reception on the other bands, however I have no information on the impact of transmit effectiveness resulting from the layer of foil.

4762. AN/UGC-144 TERMINALS

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-04 00:00:00 UTC
From: Omer@Concentric.net
Message-ID: <873359136.30015@dejanews.com>
Source record: 166858
Cross-posted to: comp.terminals,rec.radio.amateur.equipment,sci.electronics.com

An internet access impaired colleague asked me to post the following:

I picked up a couple of "Terminals, Communications AN/UGC-144 (NSN 7025-01-262-4611)" circa 1989-1991. They look like large armored "lunch-box" style laptop computers. They have a 3.5 inch floppy and a 40 meg hard drive running a 386 DOS processor. They appear to be used for transmitting messages via radio or landline apparatus in various digital packet burst modes. Here is my question, upon powering up the units, they default to a menu. One of the menu options is "UTILITY." When you select "utility" the screen gives you a new menu where "EXIT TO DOS" is one of the selections. However, when you attempt to exit to DOS, the terminal prompts you for a password. I AM TRYING TO FIGURE OUT WHAT THE DEFAULT PASSWORD FOR THESE UNITS IS SO I CAN AT LEAST USE THEM TO RUN DEMO PROGRAMS AS A CONVERSATION PIECE. Can anyone help? I've already tried the obvious solutions such as booting off a floppy, etc. Am also interested in any opinions on what they are worth. Thanks in advance... Tracy WH6HR

> together. I guess it depends on the individual and his interest.

Many universities don't have courses where students have to use
soldering, or wire
wrap, or other circuit building techniques. Teaching labs often just
have students
build circuits on boards where you plug the wires into sockets, even
then most
seem to have a very hard time of it.

Having started out as an electronic technician and then gone to school
for my degrees,
I find the fact that many (most?) newly graduated electrical/electronic
engineers
in the US can't actually build a circuit sort of disturbing.

I know in India universities require students to learn such basics.

Subject: Kenwood TS-440S vs TS-450S? Can 440S do packet?

I am familiar with the Kenwood TS-450S which can handle packet.
There seem to be a few TS-440S for sale at prices I can afford. What are
the differences between the 440S and the 450S and can the 440S do packet?

Thanks. Steve Fine KB2YWP

I can't tell you the frequencies, but I do know they are using a Kenwood
TM-733A.

From: "Paul Nicolay" <x@merck.com>
Subject: TM-V7 Software ?

Hi Frans,

I contacted Kenwood to get more information about the protocol that is
being used to exchange data (frequencies) between the PC and the TM-V7.
However Kenwood replied that the protocol is proprietary (EZ-Clone however
got it ?!?), and that they've contacts with the makers of EZ-Clone to
distribute it themselves.

In the mean while, any information is welcome about cable-pin-layout and
protocol information (even from other Kenwood transceivers, maybe it's the

still the same) so I could eventually write the software myself.

73s ON1DJU,
Paul

From: Andrew M Cohn <andy@vais.net>
Subject: VX-1 Tip: Improving 800 MHz Reception!

You can enjoy a small but very useful improvement in the reception of the
800 MHz public service frequencies by simply wrapping the top 2.5 inches
of the stock antenna in a layer of aluminum foil. I have observed up to a
two S-unit improvement (according to the VX-1 meter), and in nearly all
cases the aluminum foil made the difference between copying or not
copying the station. For cosmetic purposes, you may then carefully wrap
the foil with a tight layer of black electrical tape. This "mod" has not
resulted in any really noticable degradation of reception on the other
bands, however I have no information on the impact of transmit
effectiveness resulting from the layer of foil.

4773. RFI in Chevy Truck on 147.39

Newsgroup: rec.radio.amateur.equipment
Date: 1997-09-04 00:00:00 UTC
From: Timothy_Shearer@mk.com
Message-ID: <340EF4A4.14F@mk.com>
Source record: 166869

I bought a 95 chevy truck (1/2 ton, EFI, ABS, etc) and soon discovered that on cool mornings there is an RFI birdie which begins at about 147.375 Mhz and drifts up to about 147.430 with engine? or outside temp warmup. It about S7 - S9. It has a dead carrier, no modulation or buzzing like fuel pumps. It is a radiated signal as I get it on a handheld also.

Unfortunatley, my local club repeater is 147.390 and the receiver is fully quieted by the RFI from 147.385 to 147.395.

I haven't been able to isolate this by pulling system fuses. I have not yet built up a RF tight receiver so that I can sniff out the source. Any ideas or experiences on this welcome.

Call (616)925-4914 and ask the tech support guy. I just used this
service 2 days ago to find out about the rapid charger for an HT I
bought about 8 years ago. The guy had to go back to the file area
to get the stuff and offered to fax it to me. I don't think Heath
offers parts anymore but they do still have the tech info on file.
Get ready for a shock on the old phone bill, as the number is first
answered by a computer to give you over to the proper dept. The first
3 times I tried I got a busy on the tech dept line. The next time I
got a please wait, line is busy msg. I guess I was on hold for about
10 minutes. After I got to talk to the guy, everything went great!
He even called me back with the info I requested since I didn't have
access to a fax.
73 and Good Luck

I am selling my wife's Alinco DJ-162 handheld 2meter radio. It is in excellent shape as she has not used it much. It comes with an extra battery, a nice long whip antenna, and a plug for connecting it to the cigarette lighter. I have also installed an extra memory module so it has 50 possible presets.

I will be in Seattle on the 20th and 21st, so if anyone from Seattle wants it we can do the trade person to person.

I will also be in Indianapolis Sept 5-10th for a conference. I would be glad to meet anyone there as well.

I have about $300 into the radio with the upgrades etc but I only want to get $150 out of it. I am FIRM on this price and WILL NOT DICKER as I know this is a very good price for the condition of the radio.

You can send email or if you want to catch me in Indianapolis I will be staying at the Marriot on Sept 5th and the Westin from Sept 6 thru Sept 10th.

Dave Calhoun

4779. FS: Cushcraft A3S w/ 40m add-on & Yaesu Rotor

The old Alpha and Bravo VHF channels are probably totally out of use. It would be AM mode if present. All UHF stuff here is AM Mode. Ground crews love their new radios and use them quite a bit, about 1/2 scrambled last year. Some use at remote sights. There should be at least 3 other freqs active on the ground crews radios, so keep searching. Also check show / platform control, tower freqs and other area air traffic. I'd start searching the 225-400 Mhz military band a day or so before the show as the Angels will be up spotting the show, giving media rides, etc. Please post

Blue Angels Airshow Freq Info what you find active the show.
